Voyce, 1954 **American air mass properties**, 1906 In this paper the term Air Mass is applied to an extensive portion of the earth's atmosphere which approximates horizontal homogeneity The formation of an air mass in this sense takes place on the earth's surface wherever the atmosphere remains at rest over an extensive area of uniform surface properties for a sufficiently long time so that the properties of the atmosphere vertical distribution of temperature and moisture reach equilibrium with respect to the surface beneath Such a region on the earth's surface is referred to as a source region of air masses As examples of source regions we might cite the uniformly snow and ice covered northern portion of the continent of North America in winter or the uniformly warm waters of the Gulf of Mexico and Caribbean Sea Obviously the properties of an air mass in the source region will depend entirely upon the nature of the source region The concept of the air mass is of importance not only in the source regions Sooner or later a general movement of the air mass from the source region is certain to occur as one of the large scale air currents which we find continually moving across the synoptic charts Because of the great extent of such currents and the conservatism of the air mass properties it is usually easy to trace the movement of the air mass from day to day while at the same time any modification of its properties by its new environment can be carefully noted Since this modification is not likely to be uniform throughout the entire air mass it may to a certain degree destroy the horizontal homogeneity of the mass However the horizontal differences produced within an air mass in this manner are small and continuous in comparison to the abrupt and discontinuous transition zones or fronts which mark the boundaries between air masses Frontal discontinuities are intensified wherever there is found in the atmosphere convergent movement of air masses of different properties Since the air masses from part
