Local Theories of Argument Dale Hamble, 2021-03-25 Argumentation is often understood as a coherent set of Western theories birthed in Athens and developing throughout the Roman period the Middle Ages the Enlightenment and Renaissance and into the present century Ideas have been nuanced developed and revised but still the outline of argumentation theory has been recognizable for centuries or so it has seemed to Western scholars The 2019 Alta Conference on Argumentation co sponsored by the National Communication Association and the American Forensic Association aimed to question the generality of these intellectual traditions This resulting collection of essays deals with the possibility of having local theories of argument local to a particular time a particular kind of issue a particular place or a particular culture Many of the papers argue for reconsidering basic ideas about arguing to represent the uniqueness of some moment or location of discourse Other scholars are more comfortable with the Western traditions and find them congenial to the analysis of arguments that originate in discernibly distinct circumstances The papers represent different methodologies cover the experiences of different nations at different times examine varying sorts of argumentative events speeches court decisions food choices and sound explore particular personal identities and the issues highlighted by them and have different overall orientations to doing argumentation scholarship Considered together the essays do not generate one simple conclusion but they stimulate reflection about the particularity or generality of the experience of arguing and therefore the scope of our theories **The**

An Artificial History of Natural Intelligence David W. Bates, 2024-04-02 A new history of human intelligence that argues that humans know themselves by knowing their machines We imagine that we are both in control of and controlled by our bodies autonomous and yet automatic This entanglement according to David W Bates emerged in the seventeenth century when humans first built and compared themselves with machines Reading varied thinkers from Descartes to Kant to Turing Bates reveals how time and time again technological developments offered new ways to imagine how the body's automaticity worked alongside the mind's autonomy Tracing these evolving lines of thought *An Artificial History of Natural Intelligence* offers a new theorization of the human as a being that is dependent on technology and produces itself as an artificial automaton without a natural outside origin

Information Michele Kennerly, Samuel Frederick, Jonathan E. Abel, 2021-01-19 For decades we have been told we live in the information age a time when disruptive technological advancement has reshaped the categories and social uses of knowledge and when quantitative assessment is increasingly privileged Such methodologies and concepts of information are usually considered the provenance of the natural and social sciences which present them as politically and philosophically neutral Yet the humanities should and do play an important role in interpreting and critiquing the historical cultural and conceptual nature of information This book is one of two companion volumes that explore theories and histories of information from a humanistic perspective They consider information as a long standing feature of social cultural and conceptual management a matter of social practice and a fundamental challenge for the humanities today Bringing together essays by prominent critics *Information Keywords* highlights the humanistic nature of information practices and concepts by thinking through key terms It describes and anticipates directions for how the humanities can contribute to our understanding of information from a range of theoretical historical and global perspectives

The Humanized Internet Akram Alfawakheeri, Monique J. Morrow, 2025-11-19 Enterprising the Internet has been a process over the past years and while this book does not set judgement it does call for a moment of pause and reflection on the impact of these technologies to individuals There are constant key themes throughout this book such as the notion of identity and identity sets e sovereignty and privacy but most importantly the function of an Internet that is inclusive and not controlled by a few organizations for their own profitability This is *The Humanized Internet* These tenets may sound libertarian but in fact we are talking about the core principles that guide the development and perhaps the return of the Internet to the people especially those who are underserved Do no evil should not just be a company motto but the driving principle behind the development of any

technologies that do impact us as individual consumers of these technologies and corresponding products Indeed there is a polarity between and Internet that is used for mass empowerment and one that can be used for mass destruction Privacy security and the management of your digital footprint should be done by you With the progression of human and machine interaction due to advances in biotech and the brain computer interface the cloud and virtual mixed reality we need to understand the impacts of these technologies to identity overall Do we require a new definition of identity What is e sovereignty and its application moving forward if we posit that the institutions that exist today may no longer be relevant in their current structure We have all read about the abuses that occur when your data falls into the hands of other entities intentionally or not The Humanized Internet is therefore a call to action your action **Algorithms to Live** Amro

are the algorithms and why do you have to learn them before you learn any programming language The algorithms are called Algorithms in English The first thing you should know is that the algorithm is not a programming language it is methods of analysis and thinking that we have to follow so you can write the code properly What's the problem with everyone being afraid of programming Most people who try to learn programming you see them they go straight in the wrong direction they start to directly study a particular programming language such as Java C C without being exposed to the principles of basic programming and without that they put the basic ideas of the program then analyzed and performed one after the other Algorithms is the hardest part in programming and when you learn it correctly it means that you are able to learn any programming language you want because in reality if you don't know how to deal with code and treat all problems that you encounter while writing the code you will surrender and stop in place when the first problem is trivial to show you the code

Introduction to Computing and Algorithms Russell L. Shackelford, 1999 Introduction to Computing and Algorithms prepares students for the world of computing by giving them a solid foundation in the study of computer science algorithms. By taking an algorithm based approach to the subject, this book helps readers grasp overall concepts rather than getting bogged down with specific syntax details of a programming language that can become obsolete. Students work with algorithms from the start and apply these ideas to real problems that computers can help solve. The benefit of this approach is that students will understand the power of computers as problem solving tools, learn to think like programmers, and gain an appreciation of the computer science discipline.
