Mathematical Statistics With Applications In R Second Edition:

Mathematical Statistics with Applications in R Kandethody M. Ramachandran, Chris P. Tsokos, 2014-09-14 Mathematical Statistics with Applications in R Second Edition offers a modern calculus based theoretical introduction to mathematical statistics and applications. The book covers many modern statistical computational and simulation concepts that are not covered in other texts such as the Jackknife bootstrap methods, the EM algorithms and Markov chain Monte Carlo MCMC methods such as the Metropolis algorithm, Metropolis Hastings algorithm and the Gibbs sampler. By combining the discussion on the theory of statistics with a wealth of real world applications, the book helps students to approach statistical problem solving in a logical manner. This book provides a step by step procedure to solve real problems making the topic more accessible. It includes goodness of fit methods to identify the probability distribution that characterizes the probabilistic behavior or a given set of data. Exercises as well as practical real world chapter projects are included and each chapter has an optional section on using Minitab, SPSS and SAS commands. The text also boasts a wide array of coverage of ANOVA, nonparametric MCMC, Bayesian and empirical methods, solutions to selected problems, data sets and an image bank for students. Advanced undergraduate and graduate students taking a one or two semester mathematical statistics course will find this book extremely useful in their studies. Step by step procedure to solve real problems making the topic more accessible. Exercises blend theory and modern applications. Practical real world chapter projects. Provides an optional section in each chapter on using Minitab, SPSS and SAS commands. Wide array of coverage of ANOVA, Nonparametric MCMC, Bayesian and empirical methods.

Modern Mathematical Statistics with Applications Jay L. Devore, Kenneth N. Berk, 2011-12-07 Modern Mathematical Statistics with Applications Second Edition strikes a balance between mathematical foundations and statistical practice. In keeping with the recommendation that every math student should study statistics and probability with an emphasis on data analysis, accomplished authors Jay Devore and Kenneth Berk make statistical concepts and methods clear and relevant through careful explanations and a broad range of applications involving real data. The main focus of the book is on presenting and illustrating methods of inferential statistics that are useful in research. It begins with a chapter on descriptive statistics that immediately exposes the reader to real data. The next six chapters develop the probability material that bridges the gap between descriptive and inferential statistics. Point estimation, inferences based on statistical intervals and hypothesis testing are then introduced in the next three chapters. The remainder of the book explores the use of this methodology in a variety of more complex settings. This edition includes a plethora of new exercises, a number of which are similar to what would be encountered on the actuarial exams that cover probability and statistics. Representative applications include investigating whether the average tip percentage in a particular restaurant exceeds the standard 15%, considering whether the flavor and aroma of Champagne are affected by bottle temperature or type of pour, modeling the relationship between college graduation rate and average SAT score and assessing the likelihood of O ring failure in space.
