Introduction

The quantum yield Q can also be described by the relative rates of the radiative and non-radiative pathways, which deactivate the excited state:

$$Q = \frac{k_r}{k_r + \sum k_{nr}} \quad [1]$$

where k_r and k_{nr} correspond to radiative and non-radiative processes, respectively. In this equation, $\sum k_{nr}$ describes the sum of the rate constants for the various processes that compete with the emission process. These processes include photochemical, and dissociative processes including other, less well characterized changes that result in a return to the ground state with simultaneous dissipation of the energy of the excited state into heat. These latter processes are collectively called non-radiative transitions and two types have been clearly recognized: intersystem crossing and internal conversion. Intersystem crossing related to the radiationless spin inversion of a singlet state (S_1) in the excited state into a triplet state (T_1).

The luminescence quantum yield is also given as the ratio of the number of photons emitted to the number of photons absorbed by the sample:

$$Q = \frac{\text{photons}_{em}}{\text{photons}_{abs}} \quad [2]$$

While measurements of the "absolute" quantum yield do require more sophisticated instrumentation [1], it is easier to determine the "relative" quantum yield of a fluorophore by comparing it to a standard with a known quantum yield. Some of the most common standards are listed in table below:

Quantum Yield [Q.Y.] Standards	Q.Y. [%]	Conditions for Q.Y. Measurements	Excitation [nm]	Ref.
Cy3	4	PBS	540	2
Cy5	27	PBS	620	2
Cresyl Violet	53	Methanol	580	3

Introduction to Organic Photochemistry John D. Coyle,1986 The purpose of this book is to provide an introductory account of the major types of organic photochemical reactions to enable those with a prior knowledge of basic organic chemistry to appreciate the differences between processes which occur photochemically through an electronically excited state and those that occur thermally directly from the electronic ground state The material is organized according to organic functional groups in parallel with the approach adopted in most general textbooks on organic chemistry In this respect it differs from many of the existing older organic photochemistry texts

Osburn,Thomas S. Bianchi,2017-01-17 A substantial increase in the number of studies using the optical properties absorbance and fluorescence of dissolved organic matter DOM as a proxy for its chemical properties in estuaries and the coastal and open ocean has occurred during the last decade We are making progress on finding the actual chemical compounds or phenomena responsible for DOM s optical properties Ultrahigh resolution mass spectrometry in particular has made important progress in making the key connections between optics and chemistry But serious questions remain and the last major special issue on DOM optics and chemistry occurred nearly 10 years ago Controversies remain from the non specific optical properties of DOM that are not linked to discrete sources and sometimes provide conflicting information The use of optics which is relatively easier to employ in synoptic and high resolution sampling to determine chemistry is a critical connection to make and can lead to major advances in our understanding of organic matter cycling in all aquatic ecosystems The contentions and controversies raised by our poor understanding of the linkages between optics and chemistry of DOM are bottlenecks that need to be addressed and overcome
