Optimal Path and Trajectory Planning for Serial Robots Alexander Reiter, 2019-11-06 Alexander Reiter describes optimal path and trajectory planning for serial robots in general and rigorously treats the challenging application of path tracking for kinematically redundant manipulators therein in particular This is facilitated by resolving both the path tracking task and the optimal inverse kinematics problem simultaneously Furthermore the author presents methods for fast computation of approximate optimal solutions to planning problems with changing parameters With an optimal solution to a nominal problem an iterative process based on parametric sensitivities is applied to rapidly obtain an approximate solution About the Author Dr Alexander Reiter is a senior scientist at the Institute of Robotics of the Johannes Kepler University JKU Linz Austria His major fields of research are kinematics dynamics and trajectory planning for kinematically redundant serial robots as well as real time methods for solving parametric non linear programming problems *Optimal Trajectory Planning and Train Scheduling for Urban Rail Transit Systems* Yihui Wang, Bin Ning, Ton van den Boom, Bart De Schutter, 2016-04-21 This book contributes to making urban rail transport fast punctual and energy efficient significant factors in the importance of public transportation systems to economic environmental and social requirements at both municipal and national levels It proposes new methods for shortening passenger travel times and for reducing energy consumption addressing two major topics 1 train trajectory planning the authors derive a nonlinear model for the operation of trains and present several approaches for calculating optimal and energy efficient trajectories within a given schedule and 2 train scheduling the authors develop a train scheduling model for urban rail systems and optimization approaches with which to balance total passenger travel time with energy efficiency and other costs to the operator Mixed integer linear programming and pseudospectral methods are among the new methods proposed for single and multi train systems for the solution of the nonlinear trajectory planning problem which involves constraints such as varying speed restrictions and maximum traction braking force Signaling systems and their effects are also accounted for in the trajectory planning model Origin destination passenger demand is included in the model formulation for train scheduling Iterative convex programming and efficient bi level approaches are utilized in the solution of the train scheduling problem In addition the splitting rates and route choices of passengers are also optimized from the system point of view The problems and solutions described in *Optimal Trajectory Planning and Train Scheduling for Urban Rail Transit Systems* will interest researchers studying public transport systems and logistics whether from an academic or practitioner background as well as providing a real application for anybody studying optimization theory and predictive control *Practical and Experimental Robotics* Ferat Sahin, Pushkin Kachroo, 2017-12-19 Taking a completely hands on approach using cheap and easily available robotics kits *Practical and Experimental Robotics* provides a detailed exploration of the construction theory and experiments for different types of robots With topics ranging from basic stamp microcontrollers to biped and propeller based robots the text contains

laboratory experiments examples with solutions and case studies The authors begin with a review of the essential elements of electronics and mechanics They describe the basic mechanical construction and electrical control of the robot then give at least one example of how to operate the robot using microcontrollers or software The book includes a reference chapter on Basic Stamp Microcontollers with example code pieces and a chapter completely devoted to PC interfacing Each chapter begins with the fundamentals then moves on to advanced topics thus building a foundation for learning from the ground up Building a bridge between technicians who have hands on experience and engineers with a deeper insight into the workings the book covers a range of machines from arm wheel and leg robots to flying robots and robotic submarines and boats Unlike most books in this field this one offers a complete set of topics from electronics mechanics and computer interface and programming making it an independent source for knowledge and understanding of robotics *Advances in Intelligent*

Applied Numerical Methods Using MATLAB Won Y. Yang,2005-05-02 In recent years with the introduction of new media products there has been a shift in the use of programming languages from FORTRAN or C to MATLAB for implementing numerical methods This book makes use of the powerful MATLAB software to avoid complex derivations and to teach the fundamental concepts using the software to solve practical problems Over the years many textbooks have been written on the subject of numerical methods Based on their course experience the authors use a more practical approach and link every method to real engineering and or science problems The main benefit is that engineers don t have to know the mathematical theory in order to apply the numerical methods for solving their real life problems An Instructor s Manual presenting detailed solutions to all the problems in the book is available online **Proceedings of the ...
