Veterinary Public Health: Veterinary Medicine's Current Challenges in a Globalised World Diana Meemken,Ivan Nastasijevic,Reinhard Fries,Suporn Thongyuan,2025-03-21 The transfer of zoonotic agents leading to diseases and epidemics is well known as well as the role played by human activity in the transmission of such agents Veterinary Public Health VPH has an essential role keeping transmissible diseases under control and it involves different disciplines and the application of different techniques VPH has generally a local and regional focus in sample collection Disease s detection may be limited to specific areas Despite this aspect of VPH the importance of exchanging data discoveries and information cannot be overlooked due to the everchanging landscape in global trade transboundary diseases and extended animal movements On a local scale VPH needs often to face different challenges starting with the infrastructures for live stocks down to optimization using new technologies as Artificial Intelligence There are instances where veterinary services are not readily available and temporary solutions need to be found as for example paraveterinary services The latter should be guaranteed by adequate professional training along the different stages of as an example the food chain production Given the transboundary nature of zoonotic agents and diseases in the last decades the One Health approach has emerged as a new and holistic approach to incorporate the different facets of Veterinary Science To strengthen this approach veterinary training should eventually dedicate more attention to public health and to preventive measures of zoonosis and epidemics This renewed focus will also have the additional benefit of defining more clearly the discipline of VPH Human Public Health with the same philosophy should include the animal ecosphere emerging diseases and zoonoses focusing on the Human Animal Interface Animal Sourced Foods for Developing Economies Muhammad Issa Khan,Aysha Sameen,2018-12-21 Animal products are good source

of disposable income for many small farmers in developing countries. In fact, livestock are often the most important cash crop in many small holder mixed farming systems. Livestock ownership currently supports and sustains the livelihoods of rural poor who depend partially or fully on livestock for their income and or subsistence. Human population growth, increasing urbanization and rising incomes are predicted to double the demand for and production of livestock products in the developing countries over the next twenty years. The future holds great opportunities for animal production in developing countries. *Animal Sourced Foods for Developing Economies* addresses five major issues: 1. Food safety and nutritional status in developing world, 2. the contribution of animal origin foods in human health, 3. Production processes of animal foods along with their preservation strategies, 4. functional outcomes of animal derived foods and finally 5. strategies, issues and policies to promote animal origin food consumption. Animal sourced food contains high biological value protein and important micronutrients required for optimal body functioning but are regarded as sources of fat that contribute to the intake of total and saturated fatty acids in diet. The quality of protein source has a direct influence on protein digestibility as a greater proportion of higher quality proteins is absorbed and becomes available for bodily functions. Animal foods have high quantity and quality of protein that includes a full complement of the essential amino acids in the right proportion. Land availability limits the expansion of livestock numbers in extensive production systems in most regions and the bulk of the increase in livestock production will come from increased productivity through intensification and a wider adoption of existing and new production and marketing technologies. The significant changes in the global consumption and demand for animal source foods along with increasing pressures on resources are having some important implications for the principal production systems. In this book, contributors critically analyze and describe different aspects of animal's origin foods. Each chapter is dedicated to a specific type of food from animal source, its nutritional significance, preservation techniques, processed products, safety and quality aspects on conceptual framework. Special attention is given to explain current food safety scenario in developing countries and contribution of animal derived food in their dietary intake. Existing challenges regarding production, processing and promotion of animal's origin foods are also addressed with possible solutions and strengthening approaches.
