This book is written by a mathematician and a theoretical biologist who have arrived at a good mutual understanding and a well worked out common notation The reader need hardly be convinced of the necessity of such a mutual understanding not only for the two investigators but also for the sciences they represent Like Moliere's hero geneticists are gradually beginning to understand that unknowingly they have been speaking in the language of cybernetics Mathematicians are unexpectedly discovering that many past and present problems and methods of genetics can be naturally formulated in the language of graph theory In this way a powerful abstract mathematical theory suddenly finds a productive application Moreover in its turn such an application begins to feed the mathematical theory by presenting it with a number of new problems The reader

may judge for himself the fruitfulness of such mutual interaction At the same time several important circumstances need to be mentioned The formalization and rigorous formulation given here embraces not only the older problems known by geneticists for many decades the construction of genetic maps the analysis of complementation etc but also comparatively new problems the construction of partial complementation maps phylogenetic trees of proteins etc
