

Exercise 1: The importance of cells

- All organisms are made of cells
 - o Many organisms are single-celled
 - o Even for multicellular organisms, the cells are the basic unit of structure and function
- The cells are composed entirely of material that can live
- All cells are defined by their distinct boundaries

Exercise 2: The study of cells, microscopes and microorganisms and the history of microbiology

- The discovery and study of cells progressed with the invention of microscopes in 1590 and their improvement in the 17th century
- An early microscope (1620), visible light passes through the specimen and then through glass lenses
 - o The lenses direct light such that the image is magnified and the eye is able to view it better
- Microscopes vary in magnification and resolving power
 - o Magnification is the amount an object enlarges in the main eye
 - o Resolving power is a measure of image clarity
 - o It is the minimum size between two points can be separated and still be distinguished as two separate points
 - o Resolution is limited by the shortest wavelength of the radiation used for imaging
- The minimum wavelength of light microscopes allow (500 nanometers long), the size of a small bacterium
- Light microscopes can magnify effectively to about 1,000 times the size of the actual specimen
 - o At higher magnifications, the resolution
- Structures observed in the 1600 century have enhanced contrast and appeared as dark and light regions to be outlined or labeled as they exist now
- Since a light microscope can resolve individual cells, it cannot resolve much of the internal structure, especially the organelles
- To observe smaller structures, we use an electron microscope (EM), which focuses a beam of electrons through the specimen or over its surface
 - o Because electrons is indirectly related to wavelength, used electron microscopes reveal smaller features than physical wavelengths than visible light have lower resolution
 - o Consequently, the resolution of a typical EM could reach 0.0001 nanometer long, but the practical limit is about 0.1 nm
- Transmission electron microscope (TEM) was used mainly to study the structure of organelles of cells
 - o A 100kV beam of electron beam through a thin section of the specimen
 - o The image is focused and magnified by electromagnets
