Algebraic Methods for Signal Processing and Communications Coding Richard E. Blahut, 1992 Algorithms for computation are a central part of both digital signal processing and decoders for error control codes and the central algorithms of the two subjects share many similarities Each subject makes extensive use of the discrete Fourier transform of convolutions and of algorithms for the inversion of Toeplitz systems of equations Digital signal processing is now an established subject in its own right it no longer needs to be viewed as a digitized version of analog signal processing Algebraic structures are becoming more important to its development Many of the techniques of digital signal processing are valid in any algebraic field although in most cases at least part of the problem will naturally lie either in the real field or the complex field because that is where the data originate In other cases the choice of field for computations may be up to the algorithm designer who usually chooses the real field or the complex field because of familiarity with it or because it is suitable for the particular application Still it is appropriate to catalog the many algebraic fields in a way that is accessible to students of digital signal processing in hopes of stimulating new applications to engineering tasks
