Side Channel Attacks And Countermeasures For Embedded Systems:

Side Channel Attacks Seokhie Hong,2019-06-12 This Special Issue provides an opportunity for researchers in the area of side channel attacks SCAs to highlight the most recent exciting technologies The research papers published in this Special Issue represent recent progress in the field including research on power analysis attacks cache based timing attacks system level countermeasures and so on

Side-Channel Analysis of Embedded Systems Maamar Ouladj,Sylvain Guilley,2021-07-28 It has been more than 20 years since the seminal publications on side channel attacks They aim at extracting secrets from embedded systems while they execute cryptographic algorithms and they consist of two steps measurement and analysis This book tackles the analysis part especially under situations where the targeted device is protected by random masking The authors explain advances in the field and provide the reader with mathematical formalizations They present all known analyses within the same notation framework which allows the reader to rapidly understand and learn contrasting approaches It will be useful as a graduate level introduction also for self study by researchers and professionals and the examples are taken from real world datasets

Embedded Computing Systems: Applications, Optimization, and Advanced Design Khalgui, Mohamed,Mosbahi, Olfa,Valentini, Antonio,2013-04-30 Embedded computing systems play an important and complex role in the functionality of electronic devices With our daily routines becoming more reliant on electronics for personal and professional use the understanding of these computing systems is crucial Embedded Computing Systems Applications Optimization and Advanced Design brings together theoretical and technical concepts of intelligent embedded control systems and their use in hardware and software architectures By highlighting formal modeling execution models and optimal implementations this reference source is essential for experts researchers and technical supporters in the industry and academia

Side-channel Analysis Carlos Moreno,2013 Side Channel Analysis plays an important role in cryptology as it represents an important class of attacks against cryptographic implementations especially in the context of embedded systems such as hand held mobile devices smart cards RFID tags etc These types of attacks bypass any intrinsic mathematical security of the cryptographic algorithm or protocol by exploiting observable side effects of the execution of the cryptographic operation that may exhibit some relationship with the internal secret parameters in the device Two of the main types of side channel attacks are timing attacks or timing analysis where the relationship between the execution time and secret parameters is exploited and power analysis which exploits the relationship between power consumption and the operations being executed by a processor as well as the data that these operations work with For power analysis two main types have been proposed simple power analysis SPA which relies on direct observation on a single measurement and

differential power analysis DPA which uses multiple measurements combined with statistical processing to extract information from the small variations in power consumption correlated to the data In this thesis we propose several countermeasures to these types of attacks with the main themes being timing analysis and SPA In addition to these themes one of our contributions expands upon the ideas behind SPA to present a constructive use of these techniques in the context of embedded systems debugging In our first contribution we present a countermeasure against timing attacks where an optimized form of idle wait is proposed with the goal of making the observable decryption time constant for most operations while maintaining the overhead to a minimum We show that not only we reduce the overhead in terms of execution speed but also the computational cost of the countermeasure which represents a considerable advantage in the context of devices relying on battery power where reduced computations translates into lower power consumption and thus increased battery life This is indeed one of the important themes for all of the contributions related to countermeasures to side channel attacks Our second and third contributions focus on power analysis specifically SPA We address the issue of straightforward implementations of binary exponentiation algorithms or scalar multiplication in the context of elliptic curve cryptography making a cryptographic system vulnerable to SPA Solutions previously proposed introduce a considerable performance penalty We propose a new method namely Square and Buffered Multiplications SABM that implements an SPA resistant binary exponentiation exhibiting optimal execution time at the cost of a small amount of storage $O(\sqrt{\ell})$ where ℓ is the bit length of the exponent The technique is optimal in the sense that it adds SPA resistance to an underlying binary exponentiation algorithm while introducing zero computational overhead We then present several new SPA resistant algorithms that result from a novel way of combining the SABM method with an alternative binary exponentiation algorithm where the exponent is split in two halves for simultaneous processing showing that by combining the two techniques we can make use of signed digit representations of the exponent to further improve performance while maintaining SPA resistance We also discuss the possibility of our method being implemented in a way that a certain level of resistance against DPA may be obtained In a related contribution we extend these ideas used in SPA and propose a technique to non intrusively monitor a device and trace program execution with the intended application of assisting in the difficult task of debugging embedded systems at deployment or production stage when standard debugging tools or auxiliary components to facilitate debugging are no longer enabled in the device One of the important highlights of this contribution is the fact that the system works on a standard PC capturing the power traces through the recording input of the sound card
