Electronics has become the largest industry surpassing agriculture, auto and heavy metal industries. It has become the industry of choice for a country to prosper, already having given rise to the phenomenal prosperity of Japan, Korea, Singapore, Hong Kong and Ireland among others. At the current growth rate, total worldwide semiconductor sales will reach 300B by the year 2000. The key electronic technologies responsible for the growth of the industry include semiconductors, the packaging of semiconductors for systems use in auto, telecom, computer, consumer, aerospace and medical industries, displays, magnetic and optical storage as well as software and system technologies. There has been a paradigm shift, however, in these technologies from mainframe and supercomputer applications at any cost to consumer applications at approximately one-tenth the cost and size. Personal computers are a good example, going from 500IMIP when products were first introduced in 1981 to a projected IIMIP within 10 years. Thin, light, portable, user-friendly and very low cost are therefore the attributes of tomorrow's computing and communications systems. Electronic packaging is defined as interconnection

powering cooling and protecting semiconductor chips for reliable systems It is a key enabling technology achieving the requirements for reducing the size and cost at the system and product level *Standard Handbook for Electrical Engineers* Donald Fink, H. Wayne Beaty, 2006-08-25 The Standard Handbook for Electrical Engineers has served the EE field for nearly a century Originally published in 1907 through 14 previous editions it has been a required resource for students and professionals This new 15th edition features new material focusing on power generation and power systems operation two longstanding strengths of the handbook that have recently become front burner technology issues At the same time the entire format of the handbook will be streamlined removing archaic sections and providing a quick easy look up experience
