Factor	Effect on rate	Diagram	Rate of reaction	Rate of reaction
Temperature	Increases		Rate of reaction increases	Rate of reaction increases
Concentration	Increases		Rate of reaction increases	Rate of reaction increases

10. Explain the effect of the following factors on the rate of reaction.

(a) Temperature: The rate of reaction increases with an increase in temperature. This is because the molecules have more kinetic energy and move faster, leading to more frequent collisions. The rate of reaction doubles for every 10°C increase in temperature.

(b) Concentration: The rate of reaction increases with an increase in concentration. This is because there are more molecules in a given volume, leading to more frequent collisions. The rate of reaction is directly proportional to the concentration of the reactants.

(c) Surface area: The rate of reaction increases with an increase in surface area. This is because a larger surface area provides more space for the reactants to collide. The rate of reaction is directly proportional to the surface area of the reactants.

(d) Catalyst: A catalyst is a substance that speeds up the rate of reaction without being consumed in the process. It works by providing an alternative pathway for the reaction with a lower activation energy.

(e) Pressure: The rate of reaction increases with an increase in pressure. This is because the molecules are forced closer together, leading to more frequent collisions. The rate of reaction is directly proportional to the pressure of the reactants.

(f) Light: The rate of reaction increases with an increase in light intensity. This is because light provides energy to the reactants, leading to more frequent collisions. The rate of reaction is directly proportional to the light intensity.

(g) Solvent: The rate of reaction increases with an increase in the volume of solvent. This is because the reactants are more spread out, leading to more frequent collisions. The rate of reaction is directly proportional to the volume of the solvent.
