Combustion Thermodynamics and Dynamics Joseph M. Powers, 2016-04-18 Combustion Thermodynamics and

Dynamics builds on a foundation of thermal science chemistry and applied mathematics that will be familiar to most undergraduate aerospace mechanical and chemical engineers to give a first year graduate level exposition of the thermodynamics physical chemistry and dynamics of advection reaction diffusion Special effort is made to link notions of time independent classical thermodynamics with time dependent reactive fluid dynamics In particular concepts of classical thermochemical equilibrium and stability are discussed in the context of modern nonlinear dynamical systems theory The first half focuses on time dependent spatially homogeneous reaction while the second half considers effects of spatially inhomogeneous advection and diffusion on the reaction dynamics Attention is focused on systems with realistic detailed chemical kinetics as well as simplified kinetics Many mathematical details are presented and several quantitative examples are given Topics include foundations of thermochemistry reduced kinetics reactive Navier Stokes equations reaction diffusion systems laminar flame oscillatory combustion and detonation

Thermal Energy Yatish T. Shah, 2018-01-12 The book details sources of thermal energy methods of capture and applications It describes the basics of thermal energy including measuring thermal energy laws of thermodynamics that govern its use and transformation modes of thermal energy conventional processes devices and materials and the methods by which it is transferred It covers 8 sources of thermal energy combustion fusion solar fission nuclear geothermal microwave plasma waste heat and thermal energy storage In each case the methods of production and capture and its uses are described in detail It also discusses novel processes and devices used to improve transfer and transformation processes

Non-equilibrium Thermodynamics Of Heterogeneous Systems (Second Edition) Signe Kjelstrup, Dick Bedeaux, 2020-08-27 This book utilizes non equilibrium thermodynamics to describe transport in complex heterogeneous media There are large coupling effects between transport of heat mass charge and chemical reactions at surfaces and it is important to know how one should properly integrate across systems where different phases are in contact There is no other book available today that gives a prescription of how to set up flux equations for transports across heterogeneous systems

Integrated Modeling of Reservoir Fluid Properties and Multiphase Flow in Offshore Production Systems Tobias R. Gessner, Jader R. Barbosa Jr., 2023-10-03 The book is intended for practicing engineers in the oil industry researchers and graduate students interested in designing and simulating offshore hydrocarbon production systems It approaches offshore oil production systems from an integrated perspective that combines the modeling of thermophysical properties of reservoir fluids and their flow as a multiphase mixture in wellbores flow lines and risers The first part of the book presents an internally consistent method to compute the critical parameters and acentric factor of Single Carbon Number SCN fractions of petroleum mixtures using state of the art multivariate fitting techniques The procedure is illustrated and validated using flash and differential liberation data from actual field samples In the second part of the book mechanistic multiphase flow models are discussed in light of their ability to predict the pressure temperature and phase holdup of production fluids in wellbores flow lines and risers Multivariate fitting procedures are again applied to

evaluate the sensitivity of the results with respect to closure relationship parameters such as slug body gas holdup wall shear stress and wall roughness in pipelines and production tubing Finally the modeling framework is validated using actual field data from offshore production wells

Fuel Cell Systems Explained Andrew L. Dicks, David A. J. Rand, 2018-03-14 Since publication of the first edition of *Fuel Cell Systems Explained* three compelling drivers have supported the continuing development of fuel cell technology These are the need to maintain energy security in an energy hungry world the desire to move towards zero emission vehicles and power plants and the mitigation of climate change by lowering of CO₂ emissions New fuel cell materials enhanced stack performance and increased lifetimes are leading to the emergence of the first truly commercial systems in applications that range from fork lift trucks to power sources for mobile phone towers Leading vehicle manufacturers have embraced the use of electric drive trains and now see hydrogen fuel cells complementing advanced battery technology in zero emission vehicles After many decades of laboratory development a global but fragile fuel cell industry is bringing the first commercial products to market This thoroughly revised edition includes several new sections devoted to for example fuel cell characterisation improved materials for low temperature hydrogen and liquid fuelled systems and real world technology implementation Assuming no prior knowledge of fuel cell technology the third edition comprehensively brings together all of the key topics encompassed in this diverse field Practitioners researchers and students in electrical power chemical and automotive engineering will continue to benefit from this essential guide to the principles design and implementation of fuel cell systems
