A Computational Fluid Dynamics

A.1 Introduction

Numerical methods using digital computers are, of course, commonly utilized to solve a wide variety of flow problems. As discussed in Chapter 6, although the differential equations that govern the flow of Newtonian fluids [the Navier–Stokes equations (Eq. 6.127)] were derived many years ago, there are few known analytical solutions to them. However, with the advent of high-speed digital computers it has become possible to obtain approximate numerical solutions to these (and other fluid mechanics) equations for a wide variety of circumstances.

Computational fluid dynamics (CFD) involves replacing the partial differential equations with discretized algebraic equations that approximate the partial differential equations. These equations are then numerically solved to obtain flow field values at the discrete points in space and/or time. Since the Navier–Stokes equations are valid everywhere in the flow field of the fluid continuum, an analytical solution to these equations provides the solution for an infinite number of points in the flow. However, analytical solutions are available for only a limited number of simplified flow geometries. To overcome this limitation, the governing equations can be discretized and put in algebraic form for the computer to solve. The CFD simulation solves for the relevant flow variables

web precalculus final exam practice problems example solve $\cos^2 x \cos x = 0$ algebraically for exact solutions in the interval $[0, 2\pi]$
 $\cos^2 x \cos x = \cos^2 x \sin^2 x \cos x = \cos^2 x (1 - \cos^2 x) = \cos^2 x - \cos^4 x = 0$ let $y = \cos^2 x$ then $y - y^2 = 0$ $y(1 - y) = 0$ $y = 0$ or $y = 1$
 $\cos^2 x = 0 \Rightarrow \cos x = 0 \Rightarrow x = \frac{\pi}{2}, \frac{3\pi}{2}$
 $\cos^2 x = 1 \Rightarrow \cos x = \pm 1 \Rightarrow x = 0, \pi, 2\pi$
