Geomorphic Response to Channel Modifications of Skuna River at the State Highway 9 Crossing at Bruce, Calhoun County, Mississippi K. Van Wilson, D. Phil Turnipseed, 1994 Water-resources Investigations Report, 1994 Evaluation of Soil Modification Mixing Procedures Robert L. Parsons, 2001 Lime is routinely used as a soil modification agent in Kansas to improve the performance of subgrade soils with the primary goal of reducing volume change Effective mixing of lime and soil is critical to ensuring that the expected improvements occur throughout the soil mass The results are presented herein on the effectiveness of current soil lime mixing and construction procedures for five soils treated with powdered quicklime or lime slurry A series of tests was performed on each soil as part of the evaluation process Test procedures included field density determination dynamic cone penetrometer unconfined compression lime content pH Atterberg limits swell testing and determination of the maximum unit weights and optimum moisture contents for the native soil and lime treated soil The effect of significantly reducing the mellowing period for ease of construction was evaluated and determined to negatively affect subgrade compaction and strength due to high water contents remaining from the mixing process Additionally the results of the testing showed that two passes with a rotary mixer were sufficient to effectively pulverize and mix the soil and lime to achieve modification However the results also suggested that there was the potential for additional strength gains with additional mixing The consistency of lime distribution on a larger scale was also evaluated and determined to be adequate at the locations observed although there was some evidence that the mixing of soil with lime in a slurry form appeared to yield a more consistent final product than mixing with powdered quicklime Several recommendations were proposed for consideration by the Kansas Department of Transportation for soil modification procedures These included moving from a specified percentage of lime for all projects to a lime percentage based on soil testing Recommendations also included the introduction of a mellowing period after preliminary mixing to allow the lime more time to react with the soil to break down clay lumps and to give the soil time to dry to a water content closer to optimum Also proposed for consideration was the adoption of National Lime Association specifications for final mixing which include the use of AASHTO T 180 as the compaction standard and requiring rotary mixing during the final stage of mixing Further evaluation of the performance of soils mixed with lime slurry compared with soils mixed with quicklime was recommended to determine if lime slurry yields a significantly better product Other recommendations proposed for consideration included an evaluation of the benefits of making soil stabilization a goal of soil treatment and taking advantage of the benefits of including the stabilized layer as a component in the pavement design Construction costs beyond those already incurred for modification should be relatively small and the additional structural benefits could yield significant savings *Fundamentals of Earthquake Engineering* Amr

S. Elnashai, Luigi Di Sarno, 2008-11-03 **Fundamentals of Earthquake Engineering** combines aspects of engineering seismology structural and geotechnical earthquake engineering to assemble the vital components required for a deep understanding of response of structures to earthquake ground motion from the seismic source to the evaluation of actions and deformation required for design The nature of earthquake risk assessment is inherently multi disciplinary Whereas **Fundamentals of Earthquake Engineering** addresses only structural safety assessment and design the problem is cast in its appropriate context by relating structural damage states to societal consequences and expectations through the fundamental response quantities of stiffness strength and ductility The book is designed to support graduate teaching and learning introduce practicing structural and geotechnical engineers to earthquake analysis and design problems as well as being a reference book for further studies **Fundamentals of Earthquake Engineering** includes material on the nature of earthquake sources and mechanisms various methods for the characterization of earthquake input motion damage observed in reconnaissance missions modeling of structures for the purposes of response simulation definition of performance limit states structural and architectural systems for optimal seismic response and action and deformation quantities suitable for design The accompanying website at www.wiley.com/go/elhashai contains a comprehensive set of slides illustrating the chapters and appendices A set of problems with solutions and worked through examples is available from the Wiley Editorial team The book slides and problem set constitute a tried and tested system for a single semester graduate course The approach taken avoids tying the book to a specific regional seismic design code of practice and ensures its global appeal to graduate students and practicing engineers
