

Fig. 22.15, surface A (shown in red) encloses the positive charge, so $Q_{\text{encd}} = +q$; surface B (in blue) encloses the negative charge, so $Q_{\text{encd}} = -q$; surface C (in purple) encloses both charges, so $Q_{\text{encd}} = +q + (-q) = 0$; and surface D (in yellow) encloses no charges, so $Q_{\text{encd}} = 0$. Hence, without having to do any integration, we have $\Phi_{EA} = +q/\epsilon_0$, $\Phi_{EB} = -q/\epsilon_0$, and $\Phi_{EC} = \Phi_{ED} = 0$. These results depend only on the charges enclosed within each Gaussian surface, not on the precise shapes of the surfaces.

We can draw similar conclusions by examining the electric field lines. All the field lines that cross surface A are directed out of the surface, so the flux through A must be positive. Similarly, the flux through B must be negative since all of the field lines that cross that

22.15 The net number of field lines leaving a closed surface is proportional to the total charge enclosed by that surface.

22.16 The net number of field lines leaving a closed surface is proportional to the total charge enclosed by that surface.

22.17 The net number of field lines leaving a closed surface is proportional to the total charge enclosed by that surface.

The net number of field lines leaving a closed surface is proportional to the total charge enclosed by that surface. This is a statement of Gauss's Law. The electric flux through a closed surface is equal to the total charge enclosed divided by the permittivity of free space, ϵ_0 .

22.18 Applications of Gauss's Law

One of the most important applications of Gauss's Law is in the calculation of the electric field of various charge distributions. In this section, we will consider three types of charge distributions: a point charge, a uniformly charged sphere, and a uniformly charged infinite line of charge.

The first example is a point charge. We will consider a point charge q located at the center of a spherical Gaussian surface of radius r . The electric field is directed radially outward from the charge, and its magnitude is the same at every point on the Gaussian surface.

Since the electric field is perpendicular to the Gaussian surface at every point, the flux through the surface is simply the product of the electric field and the area of the surface. The area of a sphere of radius r is $4\pi r^2$, so the flux is $E(4\pi r^2)$.

According to Gauss's Law, the flux is also equal to the total charge enclosed divided by ϵ_0 . In this case, the total charge enclosed is q , so we have $E(4\pi r^2) = q/\epsilon_0$.

Solving for E , we find that the electric field of a point charge is $E = q/(4\pi\epsilon_0 r^2)$. This is the same result that we obtained in Chapter 21 using Coulomb's Law. The electric field of a point charge is directed radially outward from the charge and its magnitude is proportional to the inverse square of the distance from the charge.

Nanoelectronics and Information Technology Rainer Waser, 2012-05-29 This outstanding textbook provides an introduction to electronic materials and device concepts for the major areas of current and future information technology. On about 1 000 pages it collects the fundamental concepts and key technologies related to advanced electronic materials and devices. The obvious strength of the book is its encyclopedic character providing adequate background material instead of just reviewing current trends. It focuses on the underlying principles which are illustrated by contemporary examples. The third edition now holds 47 chapters grouped into eight sections. The first two sections are devoted to principles, materials processing and characterization methods. Following sections hold contributions to relevant materials and various devices: computational concepts, storage systems, data transmission, imaging systems and displays. Each subject area is opened by a tutorial introduction written by the editor and giving a rich list of references. The following chapters provide a concise yet in depth description in a given topic. Primarily aimed at graduate students of physics, electrical engineering and information technology as well as material science, this book is equally of interest to professionals looking for a broader overview. Experts might appreciate the book for having quick access to principles as well as a source for getting insight into related fields.

Smart Maintenance for Human-Robot Interaction Bo Xing, Tshilidzi Marwala, 2017-09-08 This self contained book written by active researchers presents up to date information on smart maintenance strategies for human robot interaction (HRI) and the associated applications of novel search algorithms in a single volume eliminating the need to consult scattered resources. Unlike other books it addresses maintaining a smart HRI from three dimensions namely hardware, cyberware and hybrid asset management covering problems encountered in each through a wide variety of representative examples and elaborated illustrations. Further the diverse mathematical models and intelligent systems constructions make the book highly practical. It enables readers interested in maintenance robotics and intelligent systems but perplexed by myriads of interrelated issues to grasp basic methodologies. At the same time the referenced literature can be used as a roadmap for conducting deeper researches.
