Internet of Things (IoT) Platform Competition
Arturo Basaure, Alexandr Vesselkov, 2018 Platforms that are understood as a place or system coordinating the interaction of different stakeholders e.g. service consumers and providers may enable widespread adoption of IoT services and applications. However, the lack of interoperability between platforms may inhibit the diffusion of IoT services by preventing reaching a critical mass and reducing competition as it makes consumer switching and service provider multihoming prohibitively expensive. Moreover, network effects inherent in multisided platforms may lead to a monopoly power in IoT market. This paper analyzes the effect of consumer switching costs and provider multihoming on market structure and competition by means of agent-based modelling. Simulation results suggest that service provider multihoming plays a key role in increasing market competition when switching costs decrease due to, for example, consumer data portability.

Digitising the Industry Internet of Things: Connecting the Physical, Digital and Virtual Worlds
Ovidiu Vermesan, Peter Friess, 2022-09-01 This book provides an overview of the current Internet of Things (IoT) landscape ranging from the research innovation and development priorities to enabling technologies in a global context. A successful deployment of IoT technologies requires integration on all layers, be it cognitive and semantic aspects, middleware components, services, edge devices, machines, and infrastructures. It is intended to be a standalone book in a series that covers the Internet of Things activities of the IERC Internet of Things European Research Cluster from research to technological innovation, validation, and deployment. The book builds on the ideas put forward by the European Research Cluster and the IoT European Platform Initiative (IoT EPI) and presents global views and state-of-the-art results on the challenges facing the research, innovation, development, and deployment of IoT in the next years. The IoT is bridging the physical world with the virtual world and requires sound information processing capabilities for the digital shadows of these real things. The research and innovation in nanoelectronics, semiconductor sensors, actuators, communication, analytics, technologies, cyber-physical systems, software, swarm, intelligent, and deep learning systems are essential for the successful deployment of IoT applications. The emergence of IoT platforms with multiple functionalities enables rapid development and lower costs by offering standardised components that can be shared across multiple solutions in many industry verticals. The IoT applications will gradually move from vertical, single-purpose solutions to multi-purpose and collaborative applications interacting across industry verticals, organisations, and people, being one of the essential paradigms of the digital economy. Many of those applications still have to be identified, and involvement of end users, including the creative sector in this innovation, is crucial. The IoT applications and deployments as integrated building blocks of the new digital economy are part of the accompanying IoT policy framework to address issues of horizontal nature and common interest, i.e. privacy, end-to-end security, user acceptance, societal ethical aspects, and legal issues for providing trusted IoT solutions in a coordinated and consolidated manner across the IoT activities and pilots. In this context, IoT ecosystems offer solutions beyond a platform and solve important technical challenges in the different verticals and across

verticals These IoT technology ecosystems are instrumental for the deployment of large pilots and can easily be connected to or build upon the core IoT solutions for different applications in order to expand the system of use and allow new and even unanticipated IoT end uses Technical topics discussed in the book include Introduction Digitising industry and IoT as key enabler in the new era of Digital Economy IoT Strategic Research and Innovation Agenda IoT in the digital industrial context Digital Single Market Integration of heterogeneous systems and bridging the virtual digital and physical worlds Federated IoT platforms and interoperability Evolution from intelligent devices to connected systems of systems by adding new layers of cognitive behaviour artificial intelligence and user interfaces Innovation through IoT ecosystems Trust based IoT end to end security privacy framework User acceptance societal ethical aspects and legal issues Internet of Things Applications
