Plutonium Frank von Hippel, Masafumi Takubo, Jungmin Kang, 2019-12-23 This book provides a readable and thought provoking analysis of the issues surrounding nuclear fuel reprocessing and fast neutron reactors including discussion of resources economics radiological risk and resistance to nuclear proliferation It describes the history and science behind reprocessing and gives an overview of the status of reprocessing programmes around the world It concludes that such programs should be discontinued While nuclear power is seen by many as the only realistic solution to the carbon emission problem some national nuclear

establishments have been pursuing development and deployment of sodium cooled plutonium breeder reactors and plutonium recycling. Its proponents argue that this system would offer significant advantages relative to current light water reactor technology in terms of greater uranium utilization efficiency and that separating out the long lived plutonium and other transuranics from spent fuel and fissioning them in fast reactors would greatly reduce the duration of the toxicity of radioactive waste. However, the history of efforts to deploy this system commercially in a number of countries over the last six decades has been one of economic and technical failure and in some cases was used to mask clandestine nuclear weapon development programs. Covering topics of significant public interest including nuclear safety, fuel storage, environmental impact and the spectre of nuclear terrorism, this book presents a comprehensive analysis of the issue for nuclear engineers, policy analysts, government officials and the general public. Frank von Hippel, Jungmin Kang and Masafumi Takubo, three internationally renowned nuclear experts, have done a valuable service to the global community in putting together this book, which both historically and comprehensively covers the plutonium age as we know it today. They articulate in a succinct and clear manner their views on the dangers of a plutonium economy and advocate a ban on the separation of plutonium for use in the civilian fuel cycle in view of the high proliferation and nuclear security risks and lack of economic justification.

Mohamed ElBaradei, Director General International Atomic Energy Agency, 1997-2009, Nobel Peace Prize 2005. The 1960s dream of a plutonium economy has not delivered abundant low cost energy but instead has left the world a radioactive legacy of nuclear weapons proliferation and the real potential for nuclear terrorism. Kang, Takubo and von Hippel explain with power and clarity what can be done to reduce these dangers. The governments of the remaining countries whose nuclear research and development establishments are still pursuing the plutonium dream should pay attention. Senator Edward Markey, a leader in the US nuclear disarmament movement as a member of Congress since 1976. The authors have done an invaluable service by putting together in one place the most coherent analysis of the risks associated with plutonium and the most compelling argument for ending the practice of separating plutonium from spent fuel for any purpose. They have given us an easily accessible history of the evolution of thinking about the nuclear fuel cycle, the current realities of nuclear power around the world and arguably most important, a clear alternative path to deal with the spent fuel arising from nuclear reactors for decades to centuries to come.

Soil characteristics relevant to remedial techniques are explored, providing foundations for the correct process selection. Built upon the authors' extensive experience in research and practice, the book updates and expands

the content to include current processes and pollutants The book discusses propagation of soil pollution and soil characteristics relevant to remedial techniques Practicing geotechnical and environmental engineers can apply the theory and case studies in the book directly to current projects The book first discusses the stages of economic development and their connections to the sustainability of the environment Subsequent chapters cover waste and its management soil systems soil water and soil pollutant interactions subsurface transport of pollutants role of groundwater nano micro and biologic pollutants soil characteristics that impact pollution diffusion and potential remediation processes like mechanical electric magnetic hydraulic and dielectric permittivity of soils Presents a clear understanding of the propagation of pollutants in soils Identifies the physico chemical processes in soils Covers emerging pollutants nano micro and biologic contaminants Features in depth coverage of hydraulic electrical magnetic and dielectric permittivity characteristics of soils and their impact on remedial technologies **INIS Atomindex** ,1988 **Yearbook of Science and Technology, Taiwan ROC.** ,2007
