Engineering Applications of Dynamics Dean C. Karnopp, Donald L. Margolis, 2007-12-14 A GROUNDBREAKING TEXT THAT BRIDGES THE GAP BETWEEN THEORETICAL DYNAMICS AND INDUSTRY APPLICATIONS Designed to address the perceived failure of introductory dynamics courses to produce students capable of applying dynamic principles successfully both in subsequent courses and in practice Engineering Applications of Dynamics adopts a much needed practical approach designed to make the subject not only more relevant but more interesting as well Written by a highly respected team of authors the book is the first of its kind to tie dynamics theory directly to real world situations By touching on complex concepts only to the extent of illustrating their value in real world applications the authors provide students with a deeper understanding of dynamics in the engineering of mechanical systems Topics of interest include The formulation of equations in forms suitable for computer simulation Simulation examples of real engineering systems Applications to vehicle dynamics Lagrange's equations as an alternative formulation procedure Vibrations of lumped and distributed systems Three dimensional motion of rigid bodies with emphasis on gyroscopic effects Transfer functions for linearized dynamic systems Active control of dynamic systems A Solutions Manual with detailed solutions for all problems in this book is available at the Web site www.wiley.com/college/karnopp

Distributed Control of Robotic Networks Francesco Bullo, Jorge Cortés, Sonia Martínez, 2009-07-06 This self contained introduction to the distributed control of robotic networks offers a distinctive blend of computer science and control theory The book presents a broad set of tools for understanding coordination algorithms determining their correctness and assessing their complexity and it analyzes various cooperative strategies for tasks such as consensus rendezvous connectivity maintenance deployment and boundary estimation The unifying theme is a formal model for robotic networks that explicitly incorporates their communication sensing control and processing capabilities a model that in turn leads to a common formal language to describe and analyze coordination algorithms Written for first and second year graduate students in control and robotics the book will also be useful to researchers in control theory robotics distributed algorithms and automata theory The book provides explanations of the basic concepts and main results as well as numerous examples and exercises Self contained exposition of graph theoretic concepts distributed algorithms and complexity measures for processor networks with fixed interconnection topology and for robotic networks with position dependent interconnection topology Detailed treatment of averaging and consensus algorithms interpreted as linear iterations on synchronous networks Introduction of geometric notions such as partitions proximity graphs and multicenter functions Detailed treatment of motion coordination algorithms for deployment rendezvous connectivity maintenance and boundary estimation
