5.0 High Voltage Cables

High Voltage Cables are used when underground transmission is required. These cables are laid in ducts or may be buried in the ground. Unlike in overhead lines, air does not form part of the insulation, and the conductor must be completely insulated. Thus cables are much more costly than overhead lines. Also, unlike for overhead lines where tapplings can easily given, cables must be connected through cable boxes which provide the necessary insulation for the joint.

Cables have a much lower inductance than overhead lines due to the lower spacing between conductor and earth, but have a correspondingly higher capacitance, and hence a much higher charging current. High voltage cables are generally single cored, and hence have their separate insulation and mechanical protection by sheaths. In the older paper insulated cables, the sheath was of extruded lead. Figure 5.1 shows three such cables, as usually laid out.

Figure 5.1 - Layout of three, single-core cables

The presence of the sheath introduces certain difficulties as currents are induced in the sheath as well. This is due to fact that the sheaths of the conductors cross the magnetic fields set up by the conductor currents. At all points along the cable, the magnetic field is not the same. Hence different voltages are induced at different points on the sheath. This causes eddy currents to flow in the sheaths. These eddy currents depend mainly on (a) the frequency of operation, (b) the distance between cables, (c) the mean radius of the sheath, and (d) the resistivity of the sheath material.

5.1 Power loss in the Cable

Power loss in the cable can occur due to a variety of reasons (Figure 5.2). They may be caused by the conductor current passing through the resistance of the conductor - **conductor loss** (also sometimes called the copper loss on account of the fact that conductors were mainly made out of copper), **dielectric losses** caused by the voltage across the insulation, **sheath losses** caused by the induced currents in the sheath, and **intersheath losses** caused by circulating currents in loops formed between sheaths of different phases. The dielectric loss is voltage dependant, while the rest is current dependant.

AN INTRODUCTION TO HIGH VOLTAGE ENGINEERING SUBIR RAY, 2004-01-01 This concise textbook is intended for undergraduate students of electrical engineering offering a course in high voltage engineering. Written in an easy to understand style, the text acquaints students with the physical phenomena and technical problems associated with high voltages in power systems. A complete quantitative description of the topics in high voltage engineering is difficult because of the statistical nature of the electrical breakdown phenomena in insulators. With this in mind, this book has been written to provide a basic treatment of high voltage engineering qualitatively and wherever necessary quantitatively. Special emphasis has been laid on breakdown mechanisms in gaseous dielectrics as it helps students gain a sound conceptual base for appreciating high voltage problems. The origin and nature of lightning and switching overvoltages occurring in power systems have been explained and illustrated with practical observations. Protection of high voltage insulation against such overvoltages has also been discussed lucidly. Concept of modern digital methods of high voltage testing of insulators, transformers and cables has been explained. Solved problems help students develop a critical appreciation of the concepts discussed. End of chapter questions enable students to obtain a more in depth understanding of the key concepts.
