Abstract

There is an ongoing need to treat leachates from landfills using approaches that avoid expensive installation and operating costs. Faced with such a problem, Powys County Council (Wales, UK) developed a treatment system based on practical experience. Leachate was re-circulated through aeration towers containing a biofilm supported on plastic media before being polished in reed/filter beds.

Investigations were undertaken to evaluate the performance of these processes. Replicated model aeration towers (1/300 site scale) were used to establish treatment rates for pollutants in leachates of varying strengths; the effects of temperature and variations in pollutant concentrations were also evaluated. Data from these model experiments were corroborated with findings from pilot-scale plants (1/10 site scale) operating on landfill sites. Assessment of treatment performance was based on the degree of amelioration of standard chemical (ammoniacal-N and total organic carbon) parameters. A range of related parameters including nitrate, pH and redox potential were measured in support of these assessments.

Model system experiments indicated treatment rates at 15 °C (883-1895 mg NH₃-N m⁻³ h⁻¹; 347-1600 mg TOC m⁻³ h⁻¹) that were similar across a wide range of leachate concentrations (37-1880 mg l⁻¹ ammoniacal-N; 130-5315 mg l⁻¹ COD). Marked changes in the concentration of leachates did not affect treatment efficiency following a short lag effect. Process rates roughly halved with each 5°C decrease in temperature below 15°C, significant nitrification was maintained at temperatures of 0.5-1 °C. High variability in treatment capacity was observed for individual plastic media. Treatment rates in pilot scale plants were slightly higher but broadly consistent with those obtained in model systems.

Keywords: leachate treatment, aerobic, temperature, leachate strength, biofilm.

Sustainable Development (2 Volume Set) C.A. Brebbia, 2015-10-06 This collection of research papers presented at meetings organised by the Wessex Institute of Technology WIT concerns a variety of issues relating to the area of sustainable development WIT has a long and very successful record of organising conferences on the topic of sustainability which requires an interdisciplinary approach Any sustainable solutions that are derived solely from the perspective of a single discipline may have unintended damaging consequences that create new problems Thus effective sustainable solutions require the collaboration of scientists and engineers from various disciplines as well as planners architects environmentalists policy makers social scientists and economists The contents of this book reflect that interdisciplinary approach and include topics under the main areas of Sustainable development and planning Disaster management Air pollution Urban transport Ecosystems and Water resources management

Water Pollution XIV S. Hernández, S. Mambretti, 2018-08-21 Water pollution problems are of continued importance around the world with an impact on both populated areas and the environment This volume consists of papers presented at the 14th International Conference in the series of Monitoring Modelling and Management of Water Pollution The environmental problems caused by the increase of pollutant loads discharged into natural water bodies requires the formation of a framework for regulation and control This framework needs to be based on scientific results that relate pollutant discharge with changes in water quality The results of these studies allow industry to apply more efficient methods of controlling and treating waste loads and water authorities to enforce appropriate regulations regarding this matter Environmental problems are essentially interdisciplinary Engineers and scientists working in this field must be familiar with a wide range of issues including the physical processes of mixing and dilution chemical and biological processes mathematical modelling data acquisition and measurement to name but a few In view of the scarcity of available data it is important that experiences are shared on an international basis Thus a continuous exchange of information between scientists from different countries is essential Topics covered include Water contamination Monitoring modelling and forecasting Water management Wastewater management Groundwater and aquifers Flood damage Freshwater quality Coastal and offshore pollution Health risk studies Agricultural contamination Industrial pollution Water reuse Emerging technologies Socio economic political consequences Population and climate change Education and training

Water Resources Management IX C.A. Brebbia, Z.
