SAURABH VERMA, VENOD SINGH, D.K. VERMA AND S.P. GIRI

ABSTRACT : Agroforestry has been defined as a dynamic ecologically based natural resources management system that through the integration of trees on farms and in the agricultural landscape diversifies and sustains production for increased social, economic and environmental benefits for land users at all levels. This paper highlighted agroforestry practices and concepts in sustainable land use systems. The benefit derivable from the interface between forest trees and agricultural crops are enormous. They include the optimal use of land for both agricultural and forestry production on a sustainable basis including the improvement of the quality of soil. This is in addition to the socio-economic benefits that are accruable from agroforestry. Indeed the advantage of agroforestry is all encompassing and germane to a sustainable production system and livelihood.

INTRODUCTION

India is predominantly an agricultural country and more than 75 per cent of the population lives in villages and depends mainly on agriculture, animal husbandry and forestry. Land is the basic natural resource for man, animal and plants but more than 53 per cent of its area is under various stages of degradation. The daily requirement of food, forage, fuel wood and timber of the human and livestock has to be met from this limited resource base

of our country. Drastic reduction of forest cover in the country which is at present about 15 per cent of the total geographical area is one of the main reasons for recurring floods and droughts affecting the agricultural production and creating the environmental problems. Judicious use of degraded land can substantially cover the future needs of food, forage, fuel and timber wood in India. Hence, measures to restore such lands for productive and profitable use besides calling a halt to further degradation are required.

The International Centre for Research in Agroforestry (ICRAF, 1997) defines agroforestry as a dynamic, ecologically based, natural resources management system that through the integration of trees on farms and in the agricultural landscape diversifies and sustains production for increased social, economic and environmental benefits for all land users at all levels.
