consists of a combustion chamber nozzle and solid propellant. Each of these parts must be designed and characterized according to the parameters specified for the mission in which it is to be used. These parameters are thrust, impulse specific impulse, burning time, solid fuel type. Within the PUA, the need to reach stratospheric heights with rockets of amateur manufacture has favored the design, construction, and testing of ILLAPA 1. This amateur engine is the largest and thrust built to date with a theoretical thrust of 30kN and a weight of about 298 kg. For the design of the ILLAPA 1, variables and dimensions were used based on the software SOLMOTOR PUA and the geometry of previous rockets such as GHOST 1 to validate the design according to its structural integrity and weight. A finite element analysis was used for each of the parts that made up the ILLAPA 1. The characterization of the propellant was made based on the following variables: flammability, burning rate, hardness, and viscosity. During the construction of the ILLAPA 1, design adjustments and special materials were considered for each of the engine parts. Finally, the engine test and its failure were due to errors in the design of the chamber lid and the accumulation of pressure not expected inside the chamber.

Design, Construction and Tests of a Rocket Propulsion Motor with Hybrid Propellant in a Static Bank Laura Alejandra Arteaga Moreno, 2018 The degree project arises from the interest in hybrid rocket engines since it is a modern global technology among rocket engines and has not been built or tested in Colombia The main objective of the project is to design build and test a Design build and test a 250 N hybrid thrust rocket motor For this the motor was designed with paraffin as the solid fuel and nitrous oxide as the liquid oxidant when designing a methodology for design construction and testing In the conceptual design stage different input parameters were defined in which the pressure of the combustion chamber was 290 psi nozzle temperature of 2856 K flight time of 5 seconds specific impulse of 185 seconds with which the different elements of the combustion chamber could be designed including the nozzle Additionally the oxidant tank and the valves system were designed for their subsequent manufacture and purchase respectively At the same time the electronic system was proposed in order to measure the thrust pressure in the combustion chamber and temperature in the nozzle and the UCAND 3 benching test was redesigned to carry out the experiments which were planned with a sample of three fuel grains However it was found that the igniter did not burn completely in any test to make the reaction between fuel and oxidant be carried out satisfactorily because the burning surface area was not enough for the reaction to take place so it is necessary to change the ignition system However both the hybrid rocket engine and the benching test are ready to be used in the near future
