

A woman with dark hair, wearing a grey t-shirt, is sitting on a light-colored sofa. She is holding a large, white, circular mosquito net with a green handle. The net is partially open, and she is looking towards it. In the background, there is a potted plant with green leaves and a white wall. The overall scene is a domestic interior.

Methodologies: Biocontrol and other innovative components, and future directions Marshall Laird,James W. Miles,1983 This book supplements the information given in Volume 1 on the conventional methods of chemical control with accounts of the ecological basis and economic aspects of bio control Special attention is given to innovative approaches such as the use of entomopathogenic bacteria The other control methods discussed include the use of appropriate insect growth regulators organo phosphate and carbamate poisoning of adults and ways in which communities can help to reduce the sources of favourable environments for mosquito reproduction FROM THE PREFACE As this second and last volume of Integrated Mosquito Control Methodologies goes to press it would be heartening to be able to record a rapidly diversifying application of such solutions to pest and vector problems Regrettably this is not yet possible Our contributors have proffered much information which will serve as the basis for future such methodologies with attention to relevant application technology and a number of the examples they furnish illustrate ways in which two or more basically different approaches chemical environmental or biological have been purposely or fortuitously combined in the past Yet in assembling the chapters it proved impossible to obtain any accounts of integrated control projects so far designed and implemented for mosquito suppression on a larger scale than that of the operation against *Aedes aegypti* on the atoll of Funafuti human population circa 2000 Tuvalu an outline of which concludes this work Nevertheless this can serve as a model for far larger

undertakings employing the same innovative and conventional control agents all of them currently available commercially and appropriate new ones as they are developed also for similar approaches to public relations and community involvement For it is confidently believed that the Tuvalu methodology could be adapted with equal effect against other Culicidae of health importance from the indigenous tropical Pacific container breeders e g *Aedes polynesiensis* transmitting Bancroftian filariasis to small island populations of such surface water breeders as the Melanesian malaria vectors of the *Anopheles farauti* complex where exophily would pose new adulticiding problems while the larval habitats would be open to a wider range of biocontrol agents including appropriate larvivores the importation of which would be unlikely to pose threats to the economy in islands lacking the natural basis for a freshwater fishery We specify small island populations of vector mosquitoes in this context because the simplification of ecological circumstances pertinent to disease transmission and of public relations issues involving the humans being protected make it far easier to develop integrated control methodologies there than in continental areas with heavy urbanization *West Sacramento General Reevaluation Report* United States.
