User Friendly Features: Real worked through longitudinal data examples serving as illustrations in each chapter; Script boxes that provide code for fitting the models to example data and facilitate application to the reader's own data; Important Considerations sections offering caveats, warnings, and recommendations for the use of specific models; Companion website supplying datasets and syntax for the book's examples along with additional code in SAS R for linear mixed effects modeling. Winner Barbara Byrne Book Award from the Society of Multivariate Experimental Psychology **Basic and Advanced Bayesian Structural Equation Modeling** Sik-Yum Lee, Xin-Yuan Song, 2012-07-05 This book provides clear instructions to researchers on how to apply Structural Equation Models (SEMs) for analyzing the inter relationships between observed and latent variables. Basic and Advanced Bayesian Structural Equation Modeling introduces basic and advanced SEMs for analyzing various kinds of complex data such as ordered and unordered categorical data, multilevel data, mixture data, longitudinal data, highly non normal data, as well as some of their combinations. In addition, Bayesian semiparametric SEMs to capture the true distribution of explanatory latent variables are introduced, whilst SEM with a nonparametric structural equation to assess unspecified functional relationships among latent variables are also explored. Statistical methodologies are developed using the Bayesian approach, giving reliable results for small samples and allowing the use of prior information, leading to better statistical results. Estimates of the parameters and model comparison statistics are obtained via powerful Markov Chain Monte Carlo methods in statistical computing. Introduces the Bayesian approach to SEMs, including discussion on the selection of prior distributions and data augmentation. Demonstrates how to utilize the recent powerful tools in statistical computing, including but not limited to the Gibbs sampler, the Metropolis-Hastings algorithm, and path sampling, for producing various statistical results such as Bayesian estimates and Bayesian model comparison statistics in the analysis of basic and advanced SEMs. Discusses the Bayes factor, Deviance Information Criterion (DIC), and L_{ν} measure for Bayesian model comparison. Introduces a number of important generalizations of SEMs, including multilevel and mixture SEMs, latent curve models, and longitudinal SEMs, semiparametric SEMs, and those with various types of discrete data and nonparametric structural equations. Illustrates how to use the freely available software WinBUGS to produce the results. Provides numerous real examples for illustrating the theoretical concepts and computational procedures.
