only 60% for multi drug resistant TB MDR TB on average worldwide Early detection of TB cases is the first step to providing patients with appropriate treatment Recognizing drug resistant TB is more challenging and requires quick and accurate drug susceptibility test DST methods In addition to improved diagnosis and DST the discovery of new drug targets is crucial for TB control This Research Topic focusses on TB and drug resistance diagnosis and drug target discovery It aims to explore novel TB diagnosis methods to quickly find TB cases and recognize drug resistance DST for anti TB drugs is also essential to guide the further diagnosis of drug resistant TB how to evaluate and compare them and establish new DST methods to further guide clinics to use rationally is the other purpose under this topic At the same time this Research Topic aims to explore new drug resistance mechanisms and tools to study drug resistance Finally it explores new drug targets and tools to study them

estimated that a third of humankind is already infected by *Mycobacterium tuberculosis*. The vast majority of the infected do not know about their status. *Mycobacterium tuberculosis* is a silent pathogen causing no symptomatology at all during the infection. In addition, infected people cannot cause further infections. Unfortunately, an estimated 10 per cent of the infected population has the probability to develop the disease, making it very difficult to eradicate. Once in this stage, the bacilli can be transmitted to other persons, and the development of clinical symptoms is very progressive. Therefore, the diagnosis, especially the discrimination between infection and disease, is a real challenge. In this book, we present the experience of worldwide specialists on the diagnosis along with its lights and shadows.
