Photo-Stereolithography for Engineering Heterogeneities in Intelligent Shape Memory Polymers with Tunable Performance Zhongkun Zhao, 2024 This research explores the enhancement of Shape Memory Polymers (SMPs) using advanced grayscale halftoning assisted stereolithography, a technique that enables precise design and fabrication of SMPs with tailored mechanical properties and dynamic responses to external stimuli. With the ability to detect and respond to a wide range of external stimuli, intelligent materials have been rapidly developed, creating significant potential in a number of industrial and technological fields, including biomedical devices, soft robotics, actuators, and sensors. Shape memory polymer (SMP) as one of the most promising categories in intelligent materials has gained much research interest due to its unique programmable characteristics. More recently, these advancements can be promoted by the emergence of 3D printing technology, which is also called additive manufacturing, enabling the rapid fabrication of SMP-based intelligent devices with complex architectures. Nonetheless, several challenges remain that must be addressed to develop SMPs that possess robust mechanical qualities and tunable stimuli-responsive capabilities. This research established a novel grayscale-assisted stereolithography-based printing that can precisely design and fabricate SMP materials with improved mechanical properties and programmable behaviors upon external stimuli. Specifically, these advancements can be achieved through 1. Optimization of printing and programming processes. Stereolithography-based printing technology is a widely employed vat polymerization procedure that enables the design of liquid photo-sensitive resin formulation. This research has successfully analyzed the intrinsic characteristics of liquid resin and has subsequently optimized its composition through the selection of individual components and their respective weight percentages. In addition, the investigation of parameters related to the printing process, such as exposure time, layer thickness, and printing power, and programming procedure, including programming temperature, critical angle for torsion, and applied load, have been conducted with the aim of enhancing the mechanical and shape memory properties of SMPs. 2. Novel Concept of bio-inspired graded domains. This research introduces a completely new concept and strategy for fabricating intelligent materials. Inspired by natural structures with high mechanical robustness, such as fish scale and tendon to bone, the concept of functional graded domains has been incorporated into structural design of SMPs. Heterogeneity domains, regions with different UV exposures, are utilized to achieve various graded structures, which are different from the composite materials of involving dissimilar materials, such as reinforced inclusions within a matrix. This research utilizes a consistent resin precursor to create various heterogeneity domains inside a singular material through the

manipulation of site specific photo polymerization This technique facilitates the control of gradients orientations and crosslinking hence permitting the adjustment of overall characteristics of the fabricated SMP based devices 3 Advanced grayscale halftoning assisted Printing Technique A novel printing technique was established in this work which combines stereolithography based printing with a fixed height unit cell By utilizing grayscale halftoning methods it is possible to control the transition interfaces and orientations between relatively rigid and soft regions in a SMP based actuator The utilization of dynamic masks in stereolithography facilitates precise control over local material properties and heterogeneities by spatially and temporally manipulating cure times As a result the material properties can be highly adjusted to achieve certain functionalities 4 In Situ Characterization and simulations This research used mechanical tests specifically the tensile test and torsional test to examine the impact of each variable in the design on the mechanical properties of SMPs In addition digital imaging correlation DIC methodology was employed to examine local mechanical properties across various heterogeneity designs in order to obtain a thorough comprehension of the underlying mechanisms behind tunable mechanical and thermal stimuli responsive behaviors This non destructive technique offers temporal resolution in elucidating mechanical properties throughout the process of deformation Furthermore finite element analysis FEA was employed as a simulation approach to validate the findings derived from the characterizations 5 SMP based actuator with various forms for different applications This work involved the development and production of shape memory polymers SMPs in various forms to meet the demands for intelligent actuators Fiber shaped SMPs with a twisted and coiled structure were utilized as rotational micro engines to generate torsional energy in response to thermal stimuli In order to accommodate larger actuation strokes and provide unique mechanical properties additional structures such as meta structures and bi layer structures were also devised in this research Consequently this study presents a novel approach to manipulate localized material characteristics and achieve highly tunable functionalities for SMP based intelligent materials The study s key findings include the successful optimization of SMP properties through innovative bio inspired graded domains and advanced printing techniques which have notably enhanced mechanical robustness and stimuli responsive capabilities Additionally it was demonstrated that precise control over material heterogeneity and functionality could be achieved culminating in the development of SMP based actuators designed for complex programmable behaviors in response to thermal stimuli The results of this study provide insights into the regulation mechanisms underlying SMPs hence increasing their potential in diverse engineering applications
