 In 1992 we initiated a research project on large scale distributed computing systems LSDCS It was a collaborative project
 involving research institutes and universities in Bologna Grenoble Lausanne Lisbon Rennes Rocquencourt Newcastle and
 Twente The World Wide Web had recently been developed at CERN but its use was not yet as common place as it is today
 and graphical browsers had yet to be developed It was clear to us and to just about everyone else that LSDCS comprising
 several thousands to millions of individual computer systems nodes would be coming into existence as a consequence both of
 technological advances and the demands placed by applications We were excited about the problems of building large
 distributed systems and felt that serious rethinking of many of the existing computational paradigms algorithms and
 structuring principles for distributed computing was called for In our research proposal we summarized the problem domain

as follows We expect LSDCS to exhibit great diversity of node and communications capability Nodes will range from mobile laptop computers workstations to supercomputers Whereas mobile computers may well have unreliable low bandwidth communications to the rest of the system other parts of the system may well possess high bandwidth communications capability To appreciate the problems posed by the sheer scale of a system comprising thousands of nodes we observe that such systems will be rarely functioning in their entirety
