Process and Tool Design for the High Integrity Die Casting of Aluminum and Magnesium Alloys Varun Nandakumar, OhioLINK Electronic Theses and Dissertations Center, 2014 The push for higher efficiency and lower emissions on present day automobiles have created a greater need for light alloys such as Aluminum and Magnesium to replace the customary steel parts in an automobile A lot of these replaced parts are in structural load bearing components on a vehicle This usually meant that processes such as the traditional High Pressure Die Casting would not be able to claim a stake in it due to its innate air and Hydrogen entrapment issues But with an overall higher maintenance of quality in the traditional process it is possible to create higher integrity parts that are usable in structural applications This thesis describes and tests some methods to improve the traditional High Pressure Die Casting process to enable it to produce higher integrity casts for Aluminum and Magnesium alloys Methods to achieve a higher quality melt are researched and a rotary degasser is used for two experimental trials of similar Aluminum alloys Similarly methods to integrate vacuum into the existing setup are studied and the tooling part of the vacuum assist system with chill blocks is fully designed The design of the chill blocks is carried out

from the ground up using MAGMA and ANSYS simulation tools which were available at the Integrated Systems Engineering Lab A designed experiment is completed to understand the effects of changing parameters on the design Finally the optimum design is completed on 3D CAD software and then manufactured in house *Latest Developments in the Field of Magnesium Alloys and their Applications* Hajo Dieringa, David StJohn, Maria Teresa Pérez, Karl Ulrich Kainer, 2021-09-13

Micro-Macro-Interactions

Albrecht Bertram, Jürgen Tomas, 2008-10-23 Many materials or media in nature and technology possess a microstructure which determines their macroscopic behaviour The knowledge of the relevant mechanisms is often more comprehensive on the micro than on the macro scale On the other hand not all information on the micro level is relevant for the understanding of this macro behaviour Therefore averaging and homogenization methods are needed to select only the specific information from the micro scale which influences the macro scale These methods also open the possibility to design or to influence microstructures with the objective to optimize their macro behaviour This book presents the development of new methods in this interdisciplinary field of macro micro interactions of different engineering branches like mechanical and process engineering applied mathematics theoretical and computational physics In particular solids with microstructures and particle systems are considered
