selected the initial lubricant charge is required to last the entire mission Fluid lubricant losses are mainly due to evaporation tribo degradation and oil creep out of the tribological regions In the past several techniques were developed to maintain the appropriate amount of oil in the system They were based on oil reservoirs cartridges impregnated porous parts barrier films and labyrinth seals Nevertheless all these systems have had limited success or have not established a proven record for space missions The system reported here provides to the ball race contact fresh lubricant in situ and on demand The lubricant is stored in a porous cartridge attached to the inner or the outer ring of a ball bearing The oil is released by heating the cartridge to eject oil taking advantage of the greater thermal expansion of the oil compared to the porous network The heating may be activated by torque increases that signal the depletion of oil in the contact The low surface tension of the oil compared to the ball bearing material is utilized and the close proximity of the cartridge to the moving balls allows the lubricant to reach the ball race contacts This oil resupply system can be used to avoid a mechanism failure or reduce torque to an acceptable level and extend the life of the component Marchetti Mario and Jones William R Jr and Pepper Stephen V and Jansen Mark J and Predmore Roamer E Glenn Research Center Goddard Space Flight Center NASA TM 2002 211706 E 13454 NAS 1 15 211706 In-situ, On-demand Lubrication System for Space Mechanisms ...
