1. INTRODUCTION

The efficiency plays a major role at present current global energy crisis is focus and electronic products are facing the daunting challenge to deliver high performance, at the same time as consuming less power. Various governmental agencies around the world have or are looking to increase their efficiency standards for numerous products in their respective specifications, as a result of this crisis. It will be difficult to meet these efficiency specifications with conventional hard switched converters. Power supply designers will require considering soft switching topologies to increase the efficiency as well as to allow for better frequency operation. Practical design considerations and resonant tank design procedure are offered for a better performance LLC multi resonant dc-dc converter in a two-stage smart battery charger for neighborhood electric vehicle applications.

The LLC resonant topology permits the zero voltage switching of the main switches thereby considerably lowering switching losses and improving efficiency. LLC resonant converters can be achieved with efficiencies of 93 to 96%. It will be illustrate the operation of the LLC resonant topology and show how such high efficiencies can be attained.

A smart charger is a battery charger that can act in response to the condition of a battery, and modify the battery charging actions compare to the battery algorithms. Conversely, a standard or simple battery charger supplies a pulsed dc or constant dc power source to a battery being charged. The charge on the battery and its output depends on time does not alter in a simple charger. Therefore, smart chargers are preferred for NEV battery charging application
