Mathematical Analysis Nicola Fusco, Paolo Marcellini, Carlo Sbordone, 2023-01-01 This work is a textbook on Mathematical Analysis written by expert lecturers in the field This textbook other than the classical differentiation and integration tools for functions of several real variables metric spaces ordinary differential equations implicit function and so on also provides opportunities to go deeper into certain topics among them the Ascoli Arzel theorem the regularity of convex functions in $\mathbb{R}^n$ L^p spaces and absolutely continuous functions all topics that are paramount in modern Mathematical Analysis Other instances include the Weierstrass theorem on polynomial approximation of continuous functions or Peano's existence theorem typically only existence without uniqueness for nonlinear ODEs and systems under general assumptions The content is discussed in an elementary way and at a successive stage some topics are examined from several more penetrating angles The agile organization of the subject matter helps instructors to effortlessly determine which parts to present during lectures and where to stop The authors believe that any textbook can contribute to the success of a lecture course only to a point and the choices made by lecturers are decisive in this respect The book is addressed to graduate or undergraduate honors students in Mathematics Physics Astronomy Computer Science Statistics and Probability attending Mathematical Analysis courses at the Faculties of Science Engineering Economics and Architecture

Functions of several variables B. Craven, 2012-12-06 This book is aimed at mathematics students typically in the second year of a university course The first chapter however is suitable for first year students Differentiable functions are treated initially from the standpoint of approximating a curved surface locally by a flat surface This enables both geometric intuition and some elementary matrix algebra to be put to effective use In Chapter 2 the required theorems chain rule inverse and implicit function theorems etc are stated and proved for n variables concisely and rigorously Chapter 3 deals with maxima and minima including problems with equality and inequality constraints The chapter includes criteria for discriminating between maxima minima and saddlepoints for constrained problems this material is relevant for applications but most textbooks omit it In Chapter 4 integration over areas volumes curves and surfaces is developed and both the change of variable formula and the Gauss Green Stokes set of theorems are obtained The integrals are defined with approximative sums expressed concisely by using step functions this preserves some geometrical and physical concept of what is happening Consequent on this the main ideas of the differential form approach are presented in a simple form which avoids much of the usual length and complexity Many examples and exercises are included

Functions of a Real Variable N. Bourbaki, 2013-12-01 This book is an English translation of the last French edition of Bourbaki's

Fonctions d'une Variable Réelle The first chapter is devoted to derivatives Taylor expansions the finite increments theorem convex functions In the second chapter primitives and integrals on arbitrary intervals are studied as well as their dependence with respect to parameters Classical functions exponential logarithmic circular and inverse circular are investigated in the third chapter The fourth chapter gives a thorough treatment of differential equations existence and unicity properties of solutions approximate solutions dependence on parameters and of systems of linear differential equations The local study of functions comparison relations asymptotic expansions is treated in chapter V with an appendix on Hardy fields The theory of generalized Taylor expansions and the Euler MacLaurin formula are presented in the sixth chapter and applied in the last one to the study of the Gamma function on the real line as well as on the complex plane Although the topics of the book are mainly of an advanced undergraduate level they are presented in the generality needed for more advanced purposes functions allowed to take values in topological vector spaces asymptotic expansions are treated on a filtered set equipped with a comparison scale theorems on the dependence on parameters of differential equations are directly applicable to the study of flows of vector fields on differential manifolds etc

A Primer of Real Analytic Functions KRANTZ, PARKS, 2013-03-09 The subject of real analytic functions is one of the oldest in mathematical analysis Today it is encountered early in one's mathematical training the first taste usually comes in calculus While most working mathematicians use real analytic functions from time to time in their work the vast lore of real analytic functions remains obscure and buried in the literature It is remarkable that the most accessible treatment of Puiseux's theorem is in Lefschetz's quite old Algebraic Geometry that the clearest discussion of resolution of singularities for real analytic manifolds is in a book review by Michael Atiyah that there is no comprehensive discussion in print of the embedding problem for real analytic manifolds We have had occasion in our collaborative research to become acquainted with both the history and the scope of the theory of real analytic functions It seems both appropriate and timely for us to gather together this information in a single volume The material presented here is of three kinds The elementary topics covered in Chapter 1 are presented in great detail Even results like a real analytic inverse function theorem are difficult to find in the literature and we take pains here to present such topics carefully Topics of middling difficulty such as separate real analyticity Puiseux series the FBI transform and related ideas Chapters 2-4 are covered thoroughly but rather more briskly **Library of Congress Subject Headings** Library of Congress. of Functions of Real Variables: Rational numbers James Pierpont, 1906 *Theory of Approximation of Functions of a Real Variable* A. F. Timan, 2014-07-22

Theory of Approximation of Functions of a Real Variable discusses a number of fundamental parts of the modern theory of approximation of functions of a real variable. The material is grouped around the problem of the connection between the best approximation of functions to their structural properties. This text is composed of eight chapters that highlight the relationship between the various structural properties of real functions and the character of possible approximations to them by polynomials and other functions of simple construction. Each chapter concludes with a section containing various problems and theorems which supplement the main text. The first chapters tackle the Weierstrass theorem, the best approximation by polynomials on a finite segment and some compact classes of functions and their structural properties. The subsequent chapters describe some properties of algebraic polynomials and transcendental integral functions of exponential type as well as the direct theorems of the constructive theory of functions. These topics are followed by discussions of differential and constructive characteristics of converse theorems. The final chapters explore other theorems connecting the best approximations functions with their structural properties. These chapters also deal with the linear processes of approximation of functions by polynomials. The book is intended for post graduate students and for mathematical students taking advanced courses as well as to workers in the field of the theory of functions.

Real-Variable Methods in Harmonic Analysis Alberto Torchinsky, 2016-06-03

Real Variable Methods in Harmonic Analysis deals with the unity of several areas in harmonic analysis with emphasis on real variable methods. Active areas of research in this field are discussed from the Calderón Zygmund theory of singular integral operators to the Muckenhoupt theory of A_p weights and the Burkholder Gundy theory of good inequalities. The Calderón theory of commutators is also considered. Comprised of 17 chapters, this volume begins with an introduction to the pointwise convergence of Fourier series of functions followed by an analysis of Cesàro summability. The discussion then turns to norm convergence, the basic working principles of harmonic analysis centered around the Calderón Zygmund decomposition of locally integrable functions and fractional integration. Subsequent chapters deal with harmonic and subharmonic functions, oscillation of functions, the Muckenhoupt theory of A_p weights and elliptic equations in divergence form. The book also explores the essentials of the Calderón Zygmund theory of singular integral operators, the good inequalities of Burkholder Gundy, the Fefferman Stein theory of Hardy spaces of several real variables, Carleson measures and Cauchy integrals on Lipschitz curves. The final chapter presents the solution to the Dirichlet and Neumann problems on C^1 domains by means of the layer potential methods. This monograph is intended for graduate students with varied backgrounds and interests ranging from operator theory to partial differential equations.
