

The loss is about 0.5% of the initial prestress, and is sometimes neglected in practice.

4. Due to shrinkage

5. Due to creep -- creep losses may be reduced by stressing at as late a date as possible. Creep is one of the larger losses.

6. Due to relaxation of the prestressing steel

Relaxation information should be obtained from the manufacturer. SABS 0100 states that the loss should not be less than the 1000 hour relaxation figure. (BS8110 gives multipliers varying from 1.5 to 2.0 on the 1000 hour figures). If the manufacturers figures are not available, a loss varying between 10% at an initial prestress of 80% to 3% for an initial prestress of 50% of characteristic strength may be assumed. For low-relaxation strand normally available, losses of 3% to 4% are commonly used.

Adequate information about items 1 to 5 is given in the codes.

Loss due to friction may be split into 2 parts, one due to 'wobble' in the sheath, which occurs even if the tendon is straight, and one due to curvature of the tendon. 'Wobble' may be attributed to the tendons sagging between supports, and thus causing additional curvature.

The effective prestress at any distance x immediately after stressing, and before the anchorage is set and 'draw-in' occurs

is given by $P_x = P_o e^{-[kx + \theta x]}$ where k is the 'wobble factor', x is the length, θ is the total angle that the tendon has turned through in radians, and μ is the friction factor.

For the unbonded tendons used locally, the value for k is often taken as .0025, (see SABS 0100). μ is sometimes taken as 0.12 for the type of tendon and sheath used locally, although CP110 gives 0.25). Report 17 gives 0.12.

FIP recommends $\mu = 0.05$, and $k = .001$, which is considerably less, but is justified for greased tendons. It is noted that some prestressing suppliers use $k = .00025$, and $\mu = .06$, based on tests.

The committee recommends $k = .001$, and $\mu = .06$ for strand available locally.

The angle turned through may be calculated by the simple geometry of the parabolas, since the tangent to a parabola passes through a point equal to the drupe of the parabola below the mid point.

In the diag. in Appendix A (From Fig. 73 report 25) the angle θ at mid span is given by

$$\text{Arctan}(2c_1/a_1) + \text{Arctan}(2(b_1 - b_2 - c_1)/(x - a_1))$$

An alternative way to calculate friction losses is to calculate the lateral pressure on the concrete due to the tendon curvature (this is normally done to calculate the moments due to prestress), and multiply the lateral pressure by the coefficient of friction. (See 'Friction losses ...by equivalent load method. E. Keyder, PCI Journal March-April 1990). It is difficult to take account of 'wobble' by this method unless an equivalent angle is added to allow for it.

The loss due to 'draw-in' is calculated on the assumption that the loss of prestress due to friction is a straight line. (See example in report 25, p36).

If the 'wedge set' or 'draw-in' is x mm, (usually 4 to 8mm) then it is assumed that friction acts in the opposite direction and if the prestress

loss is γ , and the length over which the

loss occurs is L , then if the prestress loss/metre is m (kN/m)

$$\text{now } \gamma = L/2AE = x$$

$$\text{but } \gamma = 2mL$$

$$\text{Therefore } mL^2/AE = x$$

$$\text{and } L = \sqrt{AE x / m}$$

$$\text{then } P_r = P_o - 2mL$$

i.e. knowing x, m , calculate L , then knowing P_o calculate P_r

which gives the final prestress after draw-in losses, but before losses due to shrinkage and creep.

From this the other losses are deducted to give the final prestress. For short spans the wedge-set effect is important. With greased tendons, there is a tendency for the stress in the tendon to even out over a period of time, but it is considered that a low values for friction takes account of this.

Design Of Prestressed Concrete Flat Slabs Structures:

Design of Prestressed Concrete R. I. Gilbert, Neil C. Mickleborough, 1990-09-13 Providing both an introduction to basic concepts and an in depth treatment of the most up to date methods for the design and analysis of concrete of structures Design of Prestressed Concrete will service the needs of both students and professional engineers *Recommendations for the design of flat slabs in post tension concrete using unbonded and bonded tendons* FIB - International Federation for Structural Concrete, 1980-05-01 These recommendations present a guide to the design of two way spanning post tensioned concrete flat slabs using unbonded or bonded tendons Recommendations purely related to the use of unbonded tendons are clearly marked These recommendations are intended only for the design of post tensioned flat slabs in buildings and do not include the use in bridges Post tensioned concrete construction can be defined as unbonded or bonded depending on whether the tendon ducts are filled with a cement grout in order to provide a bonded structure or whether the tendons are suitably coated and wrapped or greased and plastic covered unbonded While in a number of countries e g United States and Canada economic and construction considerations have resulted in the selection of unbonded tendons in other countries the use of the traditional bonded tendons is favoured e g Australia Some of the advantages claimed for the use of unbonded tendons can be summarized as follows Extremely low friction values tendons are fully protected against corrosion during construction maximum possible tendon drape due to the small diameter of the tendon this is of major importance in slender structures such as flat plates simple and fast placement of the tendons avoidance of grouting operations When tendons are grouted after stressing the claimed advantages are particularly that the bond between the concrete structure and the tendons increases the ultimate strength and less reliance is placed on the long term adequacy of the anchorage **Precast Prestressed Concrete for Building Structures** Kim S. The organization of the NATO ARW on Partial Prestressing was prompted by the need to explain and reduce the wide differences of expert opinion on the subject which make more difficult the acceptance of partial prestressing by the profession at large. Specifically the workshop attempted to produce a more unified picture of partial prestressing by confronting and where possible reconciling some conflicting American and European views on this subject bring theoretical advances on partial prestressing within the grasp of engineering practice provide the required background for developing some guidelines on the use of partial prestressing in agreement with existing structural concrete standards. The five themes selected for the workshop agenda were 1 Problems of Partially Prestressed Concrete 2 Partially Prestressed Concrete Members Static Loading 3 PPC Members Repeated and Dynamic Loadings 4 Continuity in Partially Prestressed Concrete 5 Practice of Partial Prestressing
