

Direct-Detection LADAR Systems

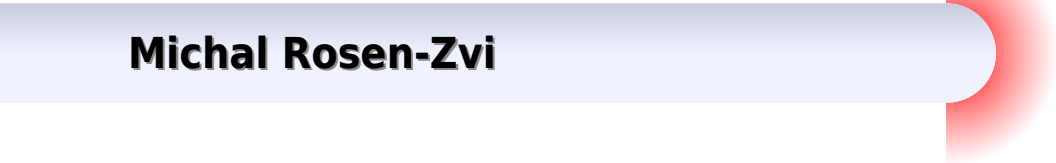

When a surface is illuminated by light, the way in which the energy is reflected depends on the surface. Rough targets scatter the incident electromagnetic energy diffusely, and the intensity of the reflected signal decreases as the wavelength of the illuminating signal increases.

Smooth surfaces, when illuminated with longer-wavelength radiation, reflect the incident energy more specularly, and the intensity of the reflected signal also decreases. At the longest wavelengths, the largest amount of energy is reflected at the specular angle, and the intensity of the reflected signal as the target viewing angle changes. As the wavelength increases, the intensity of the reflected signal decreases, and the intensity of the reflected signal decreases.
