

bridge as a practical bridge type has been brought about through a confluence of changes. These changes consist of new materials, new construction methods, and the desire to cross geography with unsuitable foundation locations or depths. Manufacturing centers and shipping routes have also changed considerably throughout the world, thereby making the cost advantages of suspension bridges economically viable once again.

While the number of suspension bridges opened to traffic in the second half of the 20th century was relatively small, the turn of the century has seen dozens of new spans open, some with remarkable span lengths. This series of case studies covers the generic day-to-day issues of suspension bridge inspection and routine maintenance, as well as periodic inspection, maintenance, and evaluation that may uncover some hidden concerns. Timeliness is crucial in arresting the various degradation processes that begin to attack the vulnerabilities of suspension bridges from the day they are built. Careful documentation of the conditions found during these inspections will be invaluable and will be intently studied by future bridge tenders. Trial and error has taught us that many layers of paint on the cable covering may not be the best solution to cable protection. Misconceptions as well as success stories are shared in the hope of advancing the state of the practice for bridge owners and operators.

The principal objective for all of us in transportation is to protect the public safety while enhancing the mobility of our communities for economic and quality-of-life improvements. However, when working with such demonstrable examples of humanity's engineering abilities, we tend to want to ensure a perpetual service life for the grandest engineering icons. Lessons learned over time will be our best asset in improving our performance in this regard. We thank all who were involved in the authorship and development of this book. Their personal efforts and contributions to the industry will not be forgotten.
