Corrosion Monitoring in Nuclear Systems EFC 56 Stefan Ritter,Anders Molander,2017-09-20 Corrosion remains one of the key issues affecting the performance and availability of nuclear power plants Therefore reliable in plant corrosion monitoring methods are essential both for the future operation of existing plants and to ensure the safety of future nuclear waste disposal systems In two parts this book was stimulated by a workshop organised by EFC Working Party 4 on Nuclear Corrosion and the European Cooperative Group on Corrosion Monitoring of Nuclear Materials EGC COMON The first part deals mainly with research into the detection of stress corrosion crack initiation in nuclear power plant environments essentially high temperature water at around 300 C by various methods particularly the electrochemical noise technique but also including the electrochemical impedance acoustic emission and direct current potential drop methods The second part addresses the goal to develop in situ techniques and includes examples of the application of electrochemical corrosion potential monitoring This book will be of particular interest to scientists and engineers concerned with the mitigation of corrosion in nuclear systems **Best Practice Guide on the Control of Iron and Manganese in Water Supply** Adam Postawa,Colin Hayes,Alessandra Criscuoli,Francesca Macedonio,Andreas N. Angelakis,Joan B. Rose,Andrew Maier,Drew C. McAvoy,2013-08-14 This Best Practice Guide on the Control of Iron and Manganese in Water Supply is one of a series produced by the International Water Association s Specialist Group on Metals and Related Substances in Drinking Water Iron and manganese are often found in soft upland water sources associated with natural organic matter and are also commonly found in the groundwater abstracted from confined and unconfined aquifers The presence of iron and manganese in water is

one of the most frequent reasons for customers complaint due to aesthetic issues yellow brown and black or stains on laundry and plumbing fixtures These two metals can be removed fairly readily by physico chemical treatment The municipal treatment systems deployed derive benefit from their larger scale particularly in relation to control but the processes used are less suitable for the numerous small supplies that are the most common water supplies throughout Europe especially in rural areas One important source of iron in drinking water is from old corroded cast iron water mains historically the material used most commonly in supply networks Replacement and refurbishment is very expensive and the major challenge is how best to prioritize available expenditure The purpose for this Best Practice Guide on the Control of Iron and Manganese in Water Supply is to give readers the broad view of a problem based on state of the art compilation of the range of scientific engineering regulatory and operational issues concerned with the control of iron and manganese in drinking water The Guide is of interest to water utility practitioners health agencies and policy makers as well as students on civil engineering and environmental engineering courses Authors Dr Adam Postawa AGH University of Science and Technology Faculty of Geology Geophysics and Environment Protection Krakow Poland and Dr Colin R Hayes University of Swansea UK Chair of IWA Specialist Group on Metals and Related Substances in Drinking Water
