M. Farid,2019-02-20 This open access book explores the collision between the sustainable energy transition and the Internet of Things IoT In that regard this book s arrival is timely Not only is the Internet of Things for energy applications herein called the energy Internet of Things eIoT rapidly developing but also the transition towards sustainable energy to abate global climate is very much at the forefront of public discourse It is within the context of these two dynamic thrusts digitization and global climate change that the energy industry sees itself undergoing significant change in how it is operated and managed This book recognizes that they impose five fundamental energy management change drivers 1 the growing demand for electricity 2 the emergence of renewable energy resources 3 the emergence of electrified transportation 4 the deregulation of electric power markets 5 and innovations in smart grid technology Together they challenge many of the assumptions upon which the electric grid was first built The goal of this book is to provide a single integrated picture of how eIoT can come to transform our energy infrastructure This book links the energy management change drivers mentioned above to the need for a technical energy management solution It then describes how eIoT meets many of the criteria required for such a technical solution In that regard the book stresses the ability of eIoT to add sensing decision making and actuation capabilities to millions or perhaps even billions of interacting smart devices With such a large scale transformation composed of so many independent actions the book also organizes the discussion into a single multi layer energy management control loop structure Consequently much attention is given to not just network enabled physical devices but also communication networks distributed control decision making and finally technical architectures and standards Having gone into the detail of these many simultaneously developing technologies the book returns to how these technologies when integrated form new applications for transactive energy In that regard it highlights several eIoT enabled energy management use cases that fundamentally change the relationship between end users utilities and grid operators Consequently the book discusses some of the emerging applications for utilities industry commerce and residences The book concludes that these eIoT applications will transform today s grid into one that is much more responsive dynamic adaptive and flexible It also concludes that this transformation will bring about new challenges and opportunities for the cyber physical economic performance of the grid and the business models of its increasingly growing number of participants and stakeholders **Intelligent IoT for the**

E-Business and Telecommunications Mohammad S. Obaidat, Enrique Cabello, 2019-01-17 This book constitutes the refereed proceedings of the 14th International Joint Conference on E Business and Telecommunications ICETE 2017 held in Madrid Spain in July 2017 ICETE is a joint international conference integrating four major areas of knowledge that are divided into six corresponding conferences International Conference on Data Communication Networking DCNET International Conference on E Business ICE B International Conference on Optical Communication Systems OPTICS International Conference on Security and Cryptography SECRYPT International Conference on Signal Processing and Multimedia SIGMAP International Conference on Wireless Information Systems WINSYS The 17 full papers presented were carefully reviewed and selected from 195 submissions The papers cover the following key areas of information and communication technologies including data communication and networking e business and telecommunications data communication networking e business optical communication systems security and cryptography signal processing and multimedia applications wireless networks and mobile systems Cooperation and Resource Allocation in Wireless Networking towards the IoT Ioannis M. Avgouleas, 2019-11-08 The Internet of Things IoT should be able to react with minimal human intervention and contribute to the Artificial Intelligence AI era requiring real time and scalable operation under heterogeneous network infrastructures This thesis investigates how cooperation and allocation of resources can contribute to the evolution of future wireless networks supporting the IoT First we examine how to allocate resources to IoT

services which run on devices equipped with multiple network interfaces. The resources are heterogeneous and not interchangeable and their allocation to a service can be split among different interfaces. We formulate an optimization model for this allocation problem, prove its complexity, and derive two heuristic algorithms to approximate the solution in large instances of the problem. The concept of virtualization is promising towards addressing the heterogeneity of IoT resources by providing an abstraction layer between software and hardware. Network function virtualization (NFV) decouples traditional network operations such as routing from proprietary hardware platforms and implements them as software entities known as virtualized network functions (VNFs). In the second paper, we study how VNF demands can be allocated to Virtual Machines (VMs) by considering the completion time tolerance of the VNFs. We prove that the problem is NP complete and devise a subgradient optimization algorithm to provide near optimal solutions. Our numerical results demonstrate the effectiveness of our algorithm compared to two benchmark algorithms. Furthermore, we explore the potential of using intermediate nodes, the so-called relays, in IoT networks. In the third paper, we study a multi-user random access network with a relay node assisting users in transmitting their packets to a destination node. We provide analytical expressions for the performance of the relay's queue and the system throughput. We optimize the relay's operation parameters to maximize the network-wide throughput while maintaining the relay's queue stability. A stable queue at the relay guarantees finite delay for the packets. Furthermore, we study the effect of the wireless link's signal-to-interference-plus-noise ratio (SINR) threshold and the self-interference (SI) cancellation on the per-user and network-wide throughput. Additionally, caching at the network edge has recently emerged as an encouraging solution to offload cellular traffic and improve several performance metrics of the network, such as throughput, delay, and energy efficiency. In the fourth paper, we study a wireless network that serves two types of traffic: cacheable and non-cacheable traffic. In the considered system, a wireless user with cache storage requests cacheable content from a data center connected with a wireless base station. The user can be assisted by a pair of wireless helpers that exchange non-cacheable content as well. We devise the system throughput and the delay experienced by the user and provide numerical results that demonstrate how they are affected by the non-cacheable packet arrivals, the availability of caching helpers, the parameters of the caches, and the request rate of the user. Finally, in the last paper, we consider a time-slotted wireless system that serves both cacheable and non-cacheable traffic with the assistance of a relay node. The latter has storage capabilities to serve both types of traffic. We investigate how allocating the storage capacity to cacheable and non-cacheable traffic affects the system throughput. Our numerical results provide useful insights into the system throughput, e.g., that it is not necessarily beneficial to increase the storage capacity for the non-cacheable traffic to realize better throughput at the non-cacheable destination node.
