1 PROBLEM SOLVING USING HEURISTICS

A general introduction to artificial intelligence methods of measurement signal processing is given in **Article 128, Nature and Scope of AI Techniques, Volume 2**.

Problem solving is the process of finding a solution when the path leading to that solution is uncertain. Even though we are familiar with several problem-solving techniques, in the real world, sometimes many problems cannot be solved by a technique we are familiar with.

Surprisingly, for some complicated problems, no straightforward solution technique is known at all. For these problems, heuristic solution techniques may be the only alternative. A heuristic can be simplified as a strategy that is powerful and general, but not absolutely guaranteed to provide best solutions.

Heuristic methods are very problem specific. Previous experience and some general rules – often called *rules of*

thumb – could help find good heuristics easier. Humans use heuristics a great deal in their problem solving. Of course, if the heuristic does fail, it is necessary for the problem solver to either pick another heuristic, or know that it is appropriate to give up.

Choosing random solutions, adopting greedy approaches, evolving the basic heuristics for finding better heuristics are just some of the popular approaches used in heuristic problem solving (Michalewicz and Fogel, 1999).

Heuristic problem solving involves finding a set of rules, or a procedure, that finds satisfactory solutions to a specific problem. A good example is finding one's way through a maze. To make the way toward the final goal, a step-by-step movement is necessary. Very often false moves are made but in most cases we solve the problem without much difficulty. For the maze problem, a simple heuristic rule could be "*choose the direction that seems to make progress*". Another good example is the job shop scheduling problem wherein the task is to schedule J_n independent jobs, where $n = [1, 2, \dots, N]$ on R_m heterogeneous resources and $m = [1, 2, \dots, M]$, with an objective of minimizing the completion time of all the jobs and utilizing all the resources effectively.

Each job J_n has processing requirement P_j cycles and resource R_m has speed of S_j cycles/unit time. Any job J_n has to be processed in resource R_m , until completion. If C_j is the completion time and the last job j finishes processing, then we define $C_{\max} = \max[C_j, j = 1, \dots, N]$, the make-span and $\sum C_j$, as the flow-time.

The task is to find an optimal schedule that optimizes the flow-time and make-span. Some simple heuristic rules to achieve this are by scheduling the Shortest Job on the Fastest Resource (SJFR), which would minimize $\sum C_j$ or by

Tree-Structure based Hybrid Computational Intelligence Yuehui Chen, Ajith Abraham, 2009-11-27 Research in computational intelligence is directed toward building thinking machines and improving our understanding of intelligence As evident the ultimate achievement in this field would be to mimic or exceed human cognitive capabilities including reasoning recognition creativity emotions understanding learning and so on In this book the authors illustrate an hybrid computational intelligence framework and its applications for various problem solving tasks Based on tree structure based encoding and the specific function operators the models can be flexibly constructed and evolved by using simple computational intelligence techniques The main idea behind this model is the flexible neural tree which is very adaptive accurate and efficient Based on the pre defined instruction operator sets a flexible neural tree model can be created and evolved This volume comprises of 6

chapters including an introductory chapter giving the fundamental definitions and the last Chapter provides some important research challenges Academics scientists as well as engineers engaged in research development and application of computational intelligence techniques and data mining will find the comprehensive coverage of this book invaluable

Intelligent Systems Design and Applications Ajith Abraham, Niketa Gandhi, Thomas Hanne, Tzung-Pei Hong, Tatiane Nogueira Rios, Weiping Ding, 2022-03-26 This book highlights recent research on intelligent systems and nature inspired computing It presents 132 selected papers from the 21st International Conference on Intelligent Systems Design and Applications ISDA 2021 which was held online The ISDA is a premier conference in the field of computational intelligence and the latest installment brought together researchers engineers and practitioners whose work involves intelligent systems and their applications in industry Including contributions by authors from 34 countries the book offers a valuable reference guide for all researchers students and practitioners in the fields of Computer Science and Engineering *Recent Advances in Intelligent Paradigms and Applications* Ajith Abraham, 2013-03-20 Digital systems that bring together the computing capacity for processing large bodies of information with the human cognitive capability are called intelligent systems Building these systems has become one of the great goals of modern technology This goal has both intellectual and economic incentives The need for such intelligent systems has become more intense in the face of the global connectivity of the internet There has become an almost insatiable requirement for instantaneous information and decision brought about by this confluence of computing and communication This requirement can only be satisfied by the construction of innovative intelligent systems A second and perhaps an even more significant development is the great advances being made in genetics and related areas of biotechnology Future developments in biotechnology may open the possibility for the development of a true human silicon interaction at the micro level neural and cellular bringing about a need for intelligent systems What is needed to further the development of intelligent systems are tools to enable the representation of human cognition in a manner that allows formal manipulation The idea of developing such an algebra goes back to Leibniz in the 17th century with his dream of a calculus ratiocinator It wasn't until two hundred years later beginning with the work of Boole Cantor and Frege that a formal mathematical logic for modeling human reasoning was developed The introduction of the modern digital computer during the Second World War by von Neumann and others was a culmination of this intellectual trend **Hybrid**
