Introduction to Operations and Supply Chain

Simulation with AnyLogic Dmitry Ivanov, William P. Millhiser, Phu Nguyen, 2025-10-12. This textbook introduces readers to the principles of business process and supply chain simulation modeling using the AnyLogic multimethod simulation software. However, the book is not a software manual; instead, it reinforces the fundamental concepts of process analysis and supply chain management through simulation models while simultaneously teaching the process of simulation modeling. Complex statistical and mathematical derivations are kept to a minimum, while managerial decision making is emphasized. Simulation games are introduced as an engaging way to comprehend system structures. The book is divided into four parts, each with the same format: presenting a motivating case study, developing technical models, providing step-by-step instructions for building AnyLogic simulation models and KPI dashboard design, using the models for classroom games and decision making, and discussing possible extensions for assignments or advanced studies. The book is intended for undergraduate and master's students in supply chain and operations management, as well as their instructors. Although some mathematical notation is necessary, the content has been carefully selected for readers without an engineering or mathematics background. Readers are encouraged to build models while reading, with the models becoming increasingly complex. Upon completing the book, readers will have learned how to create their own simulation models using popular software, gained a deeper understanding of operational and supply chain management concepts, and attained the proficiency needed to apply key performance metrics for managerial decision making.

Introduction to Operations Management Isabel Gough, 2014-11-13. Operations management is an area of management concerned with overseeing, designing, and controlling the process of production and redesigning business operations in the production of goods or services. It involves the responsibility of ensuring that business operations are efficient in terms of using as few resources as needed and effective in terms of meeting customer requirements. It is

concerned with managing the process that converts inputs in the forms of raw materials labor and energy into outputs in the form of goods and or services The relationship of operations management to senior management in commercial contexts can be compared to the relationship of line officers to highest level senior officers in military science The highest level officers shape the strategy and revise it over time while the line officers make tactical decisions in support of carrying out the strategy In business as in military affairs the boundaries between levels are not always distinct tactical information dynamically informs strategy and individual people often move between roles over time
