

- The following examples will help us understand the concept behind a system of connected bodies, the way we isolate the bodies, show the internal forces in pair, in opposite sense at the internal connection and finally apply COE to the system as well as to the isolated bodies, to get the unknowns.

EXERCISE 2

1. A two span beam ABCD is loaded as shown. Calculate support reaction.

2. A beam ABC, fixed at A and roller supported at C is internally connected by a pin at B. Determine the support reactions.

3. Find the reactions of the beam shown in figure.

4. The beam is loaded as shown in figure. Determine the reactions at fixed support roller support B and reaction at internal hinge C.

5. Find the maximum weight W that can be lifted by the crane without tipping over the wheel B as shown in figure. Calculate the corresponding reaction at 'P' and 'Q'. Weight of crane is 100 kN acting through 'C'

School of Engineering, 1928 [Lecture Notes on Composite Materials](#) Tomasz Sadowski, René de Borst, 2008-12-11 Composite materials are heterogeneous by nature and are intended to be since only the combination of different constituent materials can give them the desired combination of low weight stiffness and strength At present the knowledge has advanced to a level that materials can be tailored to exhibit certain required properties At the same time the fact that these materials are composed of various sometimes very different constituents make their mechanical behaviour complex This observation holds with respect to the deformation behaviour but especially with respect to the failure behaviour where complicated and unconventional failure modes have been observed It is a challenge to develop predictive methods that can capture this complex mechanical behaviour either using analytical tools or using numerical methods the finite element method being the most widespread among the latter In this respect

developments have gone fast over the past decade. Indeed, we have seen a paradigm shift in computational approaches to composite material behaviour. Where only a decade ago it was still customary to carry out analyses of deformation and failure at a macroscopic level of observation, only one may call this a phenomenological approach; nowadays this approach is being progressively replaced by multiscale methods. In such methods, it is recognized a priori that the overall behaviour is highly dependent on local details and laws.

Technical Abstract Bulletin, **Engineering Mechanics 2: Strength of Materials** Christian Mittelstedt, 2023-01-31. This book follows the classical division of engineering mechanics as taught at universities in Germany and is devoted to strength of materials, i.e. the determination of stresses and of deformations in elastic bodies. The aim of this book is to provide students with a clear introduction and to enable them to formulate and solve engineering problems in this field. For this purpose, the book provides a number of examples. This book is intended for university students of mechanical engineering, civil engineering, mechanics, but also all other courses in which the contents of this book play a role.

The Contents: Introduction to linear elasticity, Plane stress state, Bars, Beams, Beam deflections, Shear stresses in beams, Torsion, Energy methods, Buckling of bars.
