Modeling and Control in Air-conditioning Systems Ye Yao, Yuebin Yu, 2016-10-01 This book investigates the latest modeling and control technologies in the context of air conditioning systems Firstly it introduces the state space method for developing dynamic models of all components in a central air conditioning system The models are primarily nonlinear and based on the fundamental principle of energy and mass conservation and are transformed into state space form through linearization The book goes on to describe and discuss the state space models with the help of graph theory and the structure matrix theory Subsequently virtual sensor calibration and virtual sensing methods which are very useful for real system control are illustrated together with a case study Model based predictive control and state space feedback control are applied to air conditioning systems to yield better local control while the air side synergic control scheme and a global optimization strategy based on the decomposition coordination method are developed so as to achieve energy conservation in the central air conditioning system Lastly control strategies for VAV systems including total air volume control and trim response static pressure control are investigated in practice

Foundations of Linear and Generalized Linear Models Alan Agresti, 2015-01-15 A valuable overview of the most important ideas and results in statistical modeling. Written by a highly experienced author, *Foundations of Linear and Generalized Linear Models* is a clear and comprehensive guide to the key concepts and results of linear statistical models. The book presents a broad in-depth overview of the most commonly used statistical models by discussing the theory underlying the models, R software applications, and examples with crafted models to elucidate key ideas and promote practical model building. The book begins by illustrating the fundamentals of linear models, such as how the model fitting projects the data onto a model vector subspace and how orthogonal decompositions of the data yield information about the effects of explanatory variables. Subsequently, the book covers the most popular generalized linear models, which include binomial and multinomial logistic regression for categorical data and Poisson and negative binomial loglinear models for count data. Focusing on the theoretical underpinnings of these models, *Foundations of Linear and Generalized Linear Models* also features an introduction to quasi-likelihood methods that require weaker distributional assumptions, such as generalized estimating equation methods. An overview of linear mixed models and generalized linear mixed models with random effects for clustered correlated data, Bayesian modeling, and extensions to handle problematic cases, such as high-dimensional problems. Numerous examples that use R software for all text data analyses. More than 400 exercises for readers to practice and extend the theory, methods, and data analysis. A supplementary website with datasets for the examples and exercises. An invaluable textbook for upper undergraduate and graduate level students in statistics and biostatistics courses. *Foundations of Linear and Generalized Linear Models* is also an excellent reference for practicing statisticians and biostatisticians, as well as anyone who is interested in learning about the most important statistical models for analyzing data.

Model Predictive Control System Design and Implementation Using MATLAB® Liuping Wang, 2009-02-14 *Model Predictive Control System Design and Implementation Using MATLAB* proposes methods for design and implementation of MPC systems using basis functions that confer the following advantages: continuous and discrete time MPC problems solved in similar design frameworks; a parsimonious parametric representation

of the control trajectory gives rise to computationally efficient algorithms and better on line performance and a more general discrete time representation of MPC design that becomes identical to the traditional approach for an appropriate choice of parameters After the theoretical presentation coverage is given to three industrial applications The subject of quadratic programming often associated with the core optimization algorithms of MPC is also introduced and explained The technical contents of this book is mainly based on advances in MPC using state space models and basis functions This volume includes numerous analytical examples and problems and MATLAB programs and exercises

Climate Change and Industry Structure in China Chu Wei, 2022-07-30 As carbon dioxide is the most important source of greenhouse gases today its emission quantity has become a primary focus of governments scholars and the general public From the perspective of the structure of Chinese industry this book aims to answer two questions First what is the driving force of China's CO₂ emissions and how does this relate to the structure of industry Second what is the potential for abatement and the cost of CO₂ across sectors and regions and the impact for industry The author calculates the CO₂ inventory data at province and sectoral level based on the approach of the Intergovernmental Panel on Climate Change IPCC and then quantifies the CO₂ abatement potential and marginal abatement cost using this production framework Econometric models are used to examine the likely impact on industry of abatement potential and cost The book hence provides a rich source of information for general readers to better understand the characteristics patterns and drivers of China's CO₂ emissions It also provides solid evidence for policy makers to help mitigate CO₂ emissions through industrial restructuring strategy
