Genetic Engineering of Microorganisms for Chemicals Alexander Hollaender, 2013-04-09 The normal course of most biologically catalyzed processes is tightly regulated at the genetic and physiological levels The regulatory mechanisms are diverse sometimes redundant and it is becoming increasingly apparent that at the genetic level the range of mechanisms may be limited only by the permutations and combinations available For each microbial cell evolution appears to have resulted in maximized advantage to that cell achieving regulatory balance Genetic engineering encompasses our attempts to perturb the genetic regulation of a cell so that we may obtain desired other than normal outcomes such as increased product formation or new product formation Following the groundwork established by a preceding symposium Trends in the Biology of Fermentations for Fuels and Chemicals Brookhaven National Laboratory December 1980 the initial planning for this conference envisioned the juxtaposition of molecular genetic expertise and microbial biochemical expertise The resultant interaction should encourage new and extended ideas for the improvement of strains and for the generation of new regulatory combinations to enhance microbial chemical production from cheap and abundant including waste substrates The interaction should also demonstrate that new discoveries at the basic level remain essential to progress in genetic engineering New genetic regulatory combinations require new studies of physiology and biochemistry to assure understanding and control of the system New biochemical reactions necessitate new studies of genetic and regulatory interaction Environmental Risks of Genetically Engineered Fish United States.
