

1.2 Industrial robots - definition and classification

1.2.1 Definition (ISO 8373:2012) and delimitation

The annual surveys carried out by IFR focus on the collection of yearly statistics on the production, imports, exports and domestic installations/shipments of **industrial robots (at least three or more axes)** as described in the ISO definition given below. Figures 1.1 shows examples of robot types which are covered by this definition and hence included in the surveys.

A robot which has its own control system and is not controlled by the machine should be included in the statistics, although it may be dedicated for a special machine. Other dedicated industrial robots should not be included in the statistics. If countries declare that they included dedicated industrial robots, or are suspected of doing so, this will be clearly indicated in the statistical tables. It will imply that data for those countries is not directly comparable with those of countries that strictly adhere to the definition of multipurpose industrial robots.

- Wafer handlers have their own control system and should be included in the statistics of industrial robots. Wafers handlers can be articulated, cartesian, cylindrical or SCARA robots. Irrespective from the type of robots they are reported in the application "cleanroom for semiconductors".
- Flat panel handlers also should be included. Mainly they are articulated robots. Irrespective from the type of robots they are reported in the application "cleanroom for FPD".

Examples of dedicated industrial robots that should not be included in the international survey are:

- Equipment dedicated for loading/unloading of machine tools (see figure 1.3).
- Dedicated assembly equipment, e.g. for assembly on printed circuit boards (see figure 1.3).
- Integrated Circuit Handlers (pick and place)
- Automated storage and retrieval systems
- Automated guided vehicles (AGVs) (see "World Robotics Service Robots")

The submission of statistics on industrial robots is mandatory for IFR member associations. In some countries, however, data is also collected on all types of manipulating industrial robots, that is, both multipurpose and dedicated manipulating industrial robots. Optionally, national robot associations may therefore also submit statistics on all types of manipulating industrial robots, which will be included in the publication World Robotics under the respective country chapter.

Industrial robot as defined by ISO 8373:2012:

An automatically controlled, reprogrammable, multipurpose manipulator programmable in three or more axes, which can be either fixed in place or mobile for use in industrial automation applications

Hartley,2013-04-09 Much has been said and written about Japan s manufacturing prowess Most ofthe comment comes from people who are merely visitors to the country and can be best cclassified as observers looking in from the outside Other views come from the Japanese themselves in which the double barrier of culture and language filters out much information that would be of real value to Western industrialists Neither of these limitations apply to John Hartley who has been resident in Japan for the past five years He understands the culture can speak the language and has extensive contacts at the highest level Therefore he is in a unique position to report on the Japanese scene and its activities in advanced manufacturing technology This he has been doing on a regular basis to IFS magazines The Industrial Robot Assembly Automation Sensor Review and The FMS Magazine Most of the material in this book is from John Hartley s pen and represents his most significant contributions on flexible automation in Japan to these journals over the last three years It is augmented with a few other articles written by leading authorities on new technology in Japanese manufacturing industry **Advances in Service and Industrial Robotics** Nikos A. Control, Models and Industrial Manipulators Erik Hedberg, 2020-11-23 The two topics at the heart of this thesis are how to improve control of industrial manipulators and how to reason about the role of models in automatic control On industrial manipulators two case studies are presented The first investigates estimation with inertial sensors and the second compares control by feedback linearization to control based on gain scheduling The contributions on the second topic illustrate the close connection between control and estimation in different ways A conceptual model of control is introduced which can be used to emphasize the role of models as well as the human aspect of control engineering Some observations are made regarding block diagram reformulations that illustrate the relation between models control and inversion Finally a suggestion for how the internal model principle internal model control disturbance observers and Youla Kucera parametrization can be introduced in a unified way is presented **Fundamentals of Robotics Engineering** Harry H. Poole, 2012-12-06 Robotics engineering has progressed from an infant industry in 1961 to one including over 500 robot and allied firms around the world in 1989 During this growth period many robotics books have been published so me of which have served as industry standards Until recently the design of robotics sys tems has been primarily the responsibility of the mechanical engineer and their application in factories has been the responsibility of the manufacturing engineer Few robotics books address the many systems issues facing electron ics engineers or computer programmers The mid 1980s witnessed a major change in the robotics field The develop ment of advanced sensor systems particularly vision improvements in the intelligence area and the desire to integrate groups of robots working together in local work cells or in factory wide systems have greatly increased the partic ipation of electronics engineers and computer programmers Further as ro bots ga in mobility they are being used in completely new areas such as construction firefighting and underwater exploration and the need for com puters and smart sensors has increased Fundamentals af Rabaties Engineering is aimed at the practicing electrical engineer or computer analyst who needs to review the fundamentals of engi neering as applied to robotics and to understand the impact on system design caused by constraints unique to robotics Because there are many good texts covering mechanical engineering topics
