

Pick-up helper spring setting

The ground pressure of the pick-up can be adjusted by springs (b) which are fitted over the two hydraulic cylinders. Three different tensions can be selected by means of a sliding adjuster, the middle detent position being used for normal operating conditions.

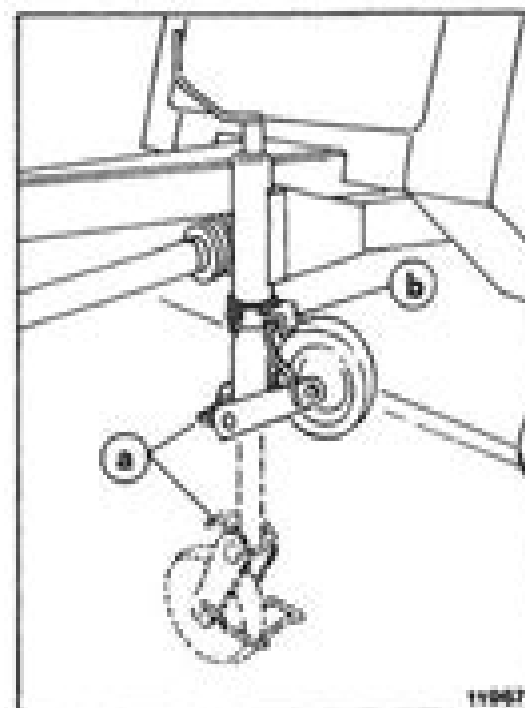

Adjustment is carried out with the pick-up raised.

- If the pick-up bounces on uneven ground, reduce the tension of the helper spring.
- If the optional gauge wheels are used then:-
for soft ground increase the helper spring pressure
for hard ground reduce the helper spring pressure.

Tractor hitching and road transport

- Hitch the baler to the tractor so that: -
 - the pick-up has sufficient ground clearance,
 - the opened tail gate leaves sufficient space for the bale to roll clear.
- Connect p.t.o. shaft with wide-angle universal joint to tractor and secure guard tubes with retaining chain to stop them rotating.
- Connect hydraulic lines and electrical cable to the tractor.
- Raise the jack a little, press down catch (a) and swing the jack wheel up until it locks.
Raise the jack wheel completely, until it is locked against the housing catch (b).
Raise pick-up, to the stop, for road travel.
Then set the two levers, provided on the control box, to "closed" position.
The pick-up and the tail gate are now hydraulically locked.

Important: When making tight turns, make sure that the wide-angle universal joint (tractor end) is not angled more than 70°, or damage to the joints will result. Damage can take place even if the machine is stationary.
