Design of Racing and High Performance Engines Joseph Harralson, 1995-02-01 This book presents in a clear and easy to understand manner the basic principles involved in the design of high performance engines. Editor Joseph Harralson first compiled this collection of papers for an internal combustion engine design course he teaches at the California State University of Sacramento. Topics covered include engine friction and output design of high performance cylinder heads multi cylinder motorcycle racing engines valve timing and how it effects performance computer modeling of valve spring and valve train dynamics correlation between valve size and engine operating speed how flow bench testing is used to improve engine performance and lean combustion. In addition two papers of historical interest are included detailing the design and development of the Ford D O H C competition engine and the coventry climax racing engine

Design of Racing and High-Performance Engines 2004-2013 Douglas Fehan, 2013-02-12 This compendium is an update to two best selling editions published by SAE International in 1995 and 2003. Editor Doug Fehan has assembled a collection of technical papers from the SAE archive that will inspire readers to use race engine development as an important tool in the future of transportation. He focuses on several topics that are important to future race engine design: electrification materials and processes and improved technology. Today's electric hybrid vehicles and kinetic energy recovery systems embody what inventors envisioned in the early 1900s. First employed in trams and trains of that era, the technology was almost forgotten until racers resurrected their version in 2009 F1 racing. The automotive industry has long admired the aircraft industry's use of lightweight metals, advanced finishing processes and composites. The use of these materials and processes has helped reduce overall mass and in turn improved speed performance and reliability of race engines. Their initial high cost was a limiting factor for integrating them into mass produced vehicles. With racing leading the way, those limitations were overcome and vehicles today feature some amazing adaptations of those processes.

and materials Engine power efficiency durability reliability and more recently emissions have always been of primary importance to the automotive world The expanding use of electrification biofuels CNG high pressure fuel delivery systems combustion air management turbocharging supercharging and low viscosity lubricants have been the focus of race engine development and are now turning up in dealer showrooms The papers in this publication were selected for two reasons they demonstrate the leadership that racing plays in the future of automotive engineering and design as it relates to engines and they will be interesting to everyone who may be in racing and to those who may want to be in racing Flying Magazine,2002-08 *Technical Literature Abstracts* Society of Automotive Engineers,1999 **Applied Science & Technology Index** ,1972 **Business History: pt. 1, Business environment** David J.
