Outline

Multiprotocol Label Switching (MPLS) extends the capabilities of IP routers and ATM switches in several key ways:

- It fully integrates IP Routing control with ATM switches, providing native support of IP services such as IP Class of Service and IP Multicast on ATM switches as well as routers.
- It provides support for scalable and flexible IP Virtual Private Network (VPN) services on both switches and routers.
- It provides support for IP Traffic Engineering, which is the fine-grained adjustment of IP traffic flows according to the resources in a network.

This version of *Designing ATM MPLS Networks* concentrates on the fundamentals of ATM MPLS network design. These fundamentals apply to all ATM MPLS networks, irrespective of the services being offered on them:

- Choosing MPLS equipment
- IP+ATM: concepts and equipment
- Designing and dimensioning ATM MPLS points of presence
- Dimensioning MPLS network links
- IP routing in ATM MPLS networks
- Dimensioning MPLS Label VC requirements
- Ongoing network design
- Migrating ATM networks to MPLS

Open Issues

Specific Comments & Errata

- 3.1: In Figure 4c it's not clear that the data flow is CPE -- MGX -- eLSR -- MPLS cloud. A revised version of the diagram would make this clearer.
- 3.4: The equations are either correct or "safe" over-estimates. However some slightly tighter limits apply to the edge LSRs in networks with switches which use unpaired cross-connects, namely the LS1010, 6400 and 8540 MSR. These should be mentioned.

Design of Nonblocking ATM Networks J. Andrew Fingerhut,1996 Abstract This paper considers the problem of designing ATM networks that are nonblocking with respect to virtual circuit requests subject to specified constraints on the traffic In this paper we focus on global traffic constraints that simply limit the total entering and exiting traffic at each switching system After reviewing prior results for linear link costs we introduce a more realistic link cost model and develop a number of results using it We also describe a technique for converting tree structured networks to nonblocking hierarchical networks satisfying limits on the capacity of any single switch

The Design and Modeling of Input and Output Modules for an ATM Network Switch Darin Murphy,1997 ABSTRACT The purpose of this thesis is to design model and simulate both an input and an output module for an ATM network switch These devices are used to interface an ATM switch with the physical protocol that is transporting data along the actual transmission medium The I O modules have been designed specifically to interface with the Synchronous Optical Network SONET protocol This thesis studies the ATM protocol and examines the issues involved with designing and ATM I O module chipset A model of the design was then implemented in both C and VHDL These models were simulated in order to verify functionality and document performance The intent of this work is to provide the background and models necessary to aid in the further study and development of entire ATM switch architectures The input and output modules are only two functional pieces of a complete ATM switch The software models that have been implemented by this thesis can be integrated with the other necessary functional blocks to form a complete model of a working ATM switch These functional blocks can then be rearranged and altered to assist in the study of how different switch architectures can effect overall network performance and efficiency The input and output modules have been designed to be as flexible as possible in order to easily adapt to future modifications
