40th AIAA/ASME/SAE/ASEE Joint Propulsion Conference & Exhibit July 11-14, 2004, Fort Lauderdale, FL.: 04-3800 - 04-3849 ,2004 **Rocket and Spacecraft Propulsion** Martin J. L. Turner,2008-11-05 The revised edition of this practical hands on book discusses the range of launch vehicles in use today throughout the world and includes the very latest details of some of the advanced propulsion systems currently being developed The author covers the fundamentals of the subject from the basic principles of rocket propulsion and vehicle dynamics through the theory and practice of liquid and solid propellant motors to new and future developments The revised edition will stick to the same principle of providing a serious exposition of the principles and practice of rocket propulsion but from the point of view of the user and enquirer who is not an engineering specialist Most chapters will remain substantially the same as the first edition they will be updated where necessary and errata corrected The main revisions will be to the chapter on electric propulsion where there have been significant new developments both in engine types and in practical applications This is now seen as the key to planetary exploration by robotic probes and should therefore be reflected Nuclear propulsion has emerged from the doldrums and is now seen as a definite possibility for outer solar system robotic exploration and as enabling technology for a human mars expedition A new chapter on nuclear thermal propulsion has been added to reflect this revival of interest **Scientific and Technical Aerospace Reports** ,1969 **44th Congress of the International Astronautical Federation** ,1993

Propulsion Conference ,1994 **Encyclopedia of Physical Science and Technology** ,2002 Of the Encyclopedia of Physical Science and Technology Has been completely updated with no less than 90% revised material and 50% new content throughout the volumes Presents eighteen volumes nearly 800 authoritative articles and 14 500 pages Is lavishly illustrated with over 7 000 photographs illustrations and tables Presents an increased emphasis on the hottest topics such as information processing environmental science biotechnology and biomedicine Includes a final Index Volume containing Thematic Relational and Subject indexes *Performance Characterization of Complex Fuel Port Geometries for Hybrid Rocket Fuel Grains* Andrew Bath,2012 Extensive research in hybrid rocket motors has taken place at the department of Mechanical and Aerospace Engineering at USU Utah State University in the last several years USU has one of the few facilities in the country capable of static test firing rocket motors on campus which allows for fast paced testing and development not available elsewhere Research has involved investigating propulsion devices for a range of applications including micro satellite thrusters hot gas generators and even jet assisted takeoff kick motors Hybrid motors have the advantage of safety over any other chemical propulsion Since the fuel and oxidizer are stored separately they are relatively inert until combined in a hot gas environment making them ideal for applications where safety is a major concern such as a secondary or tertiary payload for a major rocket launch Development of this technology has been slow as poorly designed hybrid rocket motors are not competitive with other chemical propulsion technologies but recent advances made at USU and other universities are beginning to show that hybrids do have a place in the market Hybrid research at USU has been ongoing for several years with a budget of around USD 500 000 over the last three years Most of this money has funded instrumentation and manufacturing materials as well as financial support for the graduate student research team This funding has come from multiple sources including the Space Dynamics Lab SDL the State of Utah and NASA Many technical papers have been presented at technical conferences and published in peer reviewed journals with more on the way Part of the research into hybrid rockets involves 3D printing hybrid fuel grains to obtain complex geometries inside the motor to improve performance This capability has given rise to the need to be able to model the geometric regression of these complex fuel grain structures as they burn This model must be easy to develop for any fuel grain geometry with the ability to model anything that is printable Current methods of geometric regression are either custom designed for each geometry or are slow and unstable mathematical simulations An alternative method proposed is to use image processing methods to regress a fuel grain This means all that is required to model the burnback of fuel grain geometry is a picture of a cross section of the fuel grain which is trivial to obtain from a CAD file or other sources This research will be an enabling technology for modeling new types of fuel grains that increase the performance of hybrid rocket motors allowing them to have more competitive performance against other chemical propulsion technologies
