Differential Quadrature and Differential Quadrature Based Element Methods Xinwei Wang, 2015-03-24

Differential Quadrature and Differential Quadrature Based Element Methods Theory and Applications is a comprehensive guide to these methods and their various applications in recent years. Due to the attractive features of rapid convergence, high accuracy and computational efficiency, the differential quadrature method and its based element methods are increasingly being used to study problems in the area of structural mechanics such as static buckling and vibration problems of composite structures and functional material structures. This book covers new developments and their applications in detail with accompanying FORTRAN and MATLAB programs to help you overcome difficult programming challenges. It summarises the variety of different quadrature formulations that can be found by varying the degree of polynomials, the treatment of boundary conditions and employing regular or irregular grid points to help you choose the correct method for solving practical problems. Offers a clear explanation of both the theory and many applications of DQM to structural analyses. Discusses and illustrates reliable ways to apply multiple boundary conditions and develop reliable grid distributions. Supported by FORTRAN and MATLAB programs including subroutines to compute grid distributions and weighting coefficients.

Differential Quadrature and Its Application in Engineering Chang Shu, 2012-12-06. In the past few years, the differential quadrature method has been applied extensively in engineering. This book, aimed primarily at practising engineers, scientists and graduate students, gives a systematic description of the mathematical fundamentals of differential quadrature and its detailed implementation in solving Helmholtz problems and problems of flow structure and vibration. Differential quadrature provides a global approach to numerical discretization which approximates the derivatives by a linear weighted sum of all the functional values in the whole domain. Following the analysis of function approximation and the analysis of a linear vector space, it is shown in the book that the weighting coefficients of the polynomial based, Fourier expansion based and exponential based differential quadrature methods can be computed explicitly. It is also demonstrated that the polynomial based differential quadrature method is equivalent to the highest order finite difference scheme. Furthermore, the relationship between differential quadrature and conventional spectral collocation is analysed. The book contains material on: Linear Vector Space Analysis and the Approximation of a Function; Polynomial, Fourier Expansion and Exponential based Differential Quadrature; Differential Quadrature Weighting Coefficient Matrices; Solution of Differential Quadrature resultant Equations; The Solution of Incompressible Navier Stokes and Helmholtz Equations; Structural and Vibrational Analysis; Applications; Generalized Integral Quadrature and its Application in the Solution of Boundary Layer Equations. Three FORTRAN programs for simulation of driven cavity flow, vibration analysis of plate and Helmholtz eigenvalue problems respectively are appended. These sample programs should give the reader a better understanding of differential quadrature and can easily be modified to solve the reader's own engineering problems.

Methods Zhi Zong, Yingyan Zhang, 2009-01-20 Modern Tools to Perform Numerical Differentiation The original direct differential quadrature DQ method has been known to fail for problems with strong nonlinearity and material discontinuity as well as for problems involving singularity irregularity and multiple scales But now researchers in applied mathematics computational mechanics and en

DIFFERENTIAL QUADRATURE METHOD FOR TIME-DEPENDENT DIFFUSION EQUATION. , 2003 This thesis presents the Differential Quadrature Method DQM for solving time dependent or heat conduction problem DQM discretizes the space derivatives giving a system of ordinary differential equations with respect to time and the fourth order Runge Kutta Method RKM is employed for solving this system Stabilities of the ordinary differential equations system and RKM are considered and step sizes are arranged accordingly The procedure is applied to several time dependent diffusion problems and the solutions are presented in terms of graphics comparing with the exact solutions This method exhibits high accuracy and efficiency comparing to the other numerical methods

Application of the Differential Quadrature Method to Problems in Engineering Mechanics Md Moslemuddin Fakir, 2003 The numerical solution of linear and nonlinear partial differential equations plays a prominent role in many years of engineering and physical sciences In many cases all that is desired is a moderately accurate solution at a few grid points that can be calculated rapidly The standard finite difference method currently in use have the characteristic that the solution must be calculated with a large number of mesh points in order to obtain moderately accurate results at the points of interest Consequently both the mathematical techniques involved in the finite difference schemes or in the Fourier transform methods are often quite sophisticated and thus not easily learned or used The differential quadrature method DQM is a numerical solution technique which has been presented in this thesis This method is a simple and direct technique which can be applied in a large number of cases to circumvent the difficulties of programming complex algorithms for the computer as well as excessive use of storage and computer time The initial and or boundary value problems can be solved by this method directly and efficiently The accuracy of the differential quadrature DQ method depends mainly on the accuracy of the weighting coefficient computation which is a vital key of the method In this thesis the technique has been illustrated with the solution of six partial differential equations arising in Heat transfer Poisson and Torsion problem with accurate weighting coefficient computation and two types of mesh points distribution equally spaced and unequally spaced In all cases the obtained DQ numerical results are of good accuracy with the exact solutions and hence how the potentiality of the method It is also shown that the obtained DQ results in this thesis either agree very well or improved than those of some similar published results This method is a vital alternatives to the conventional numerical methods such as finite difference and finite element methods It is expected that this technique can be applied in a large number of cases in science and engineering to circumvent both the above mentioned difficulties
