2	2	3	9	9
3	3	3	9	9

Question #2

The traditional method to implement neighborhood averaging is to perform a convolution with an $M \times M$ mask of 1's. One way to improve the computation time is to take advantage of the fact that the neighborhood for $[x+1, y]$ will overlap most of the neighborhood for $[x, y]$. Hence, we can calculate the average for pixel $[x+1, y]$ in terms of the average for pixel $[x, y]$ plus M pixels that are added to the right side of the $[x+1, y]$ region, minus M pixels that are removed from the left side of the $[x, y]$ region.

- How many operations are needed to calculate each output value using the traditional neighborhood averaging for $M \times M$ masks as M varies from 1 to 10?
- How many operations are needed to implement the fancy neighborhood averaging algorithm described above as M varies from 1 to 10?
- Do you think this approach can be used for any convolution operation? Explain why or why not.
- Do you think this approach can be extended to work for median filtering? Explain why or why not.
