Digital Signal Processing John G. Proakis, Dimitris G. Manolakis, 1992 **Biological Signal Analysis** Ramaswamy Palaniappan, 2011 *Adaptive Filtering* Paulo S. R. Diniz, 2008-05-22

The field of Digital Signal Processing has developed so fast in the last three decades that it can be found in the graduate and undergraduate programs of most universities. This development is related to the increasingly available technologies for implementing digital signal processing algorithms. The tremendous growth of development in the digital signal processing area has turned some of its specialized areas into fields themselves. If accurate information of the signals to be processed is available, the designer can easily choose the most appropriate algorithm to process the signal. When dealing with signals whose statistical properties are unknown, fixed algorithms do not process these signals efficiently. The solution is to use an adaptive filter that automatically changes its characteristics by optimizing the internal parameters. Adaptive filtering algorithms are essential in many statistical signal processing applications. Although the field of adaptive signal processing has been subject of research for over four decades, it was in the eighties that a major growth occurred in research and applications. Two main reasons can be credited to this growth: the availability of implementation tools and the appearance of early textbooks exposing the subject in an organized manner. Still today it is possible to observe many research developments in the area of adaptive filtering, particularly addressing specific applications.

Machine Learning Sergios Theodoridis, 2020-02-19

Machine Learning: A Bayesian and Optimization Perspective 2nd edition gives a unified perspective on machine learning by covering both pillars of supervised learning: namely regression and classification. The book starts with the basics, including mean square, least squares, and maximum likelihood methods, ridge regression, Bayesian decision theory, classification, logistic regression, and decision trees. It then progresses to more recent techniques, covering sparse modelling, methods learning in reproducing kernel Hilbert spaces, and support vector machines. Bayesian inference, with a focus on the EM algorithm and its approximate inference, variational versions, Monte Carlo methods, probabilistic graphical models focusing on Bayesian networks, hidden Markov models, and particle filtering. Dimensionality reduction and latent variables modelling are also considered in depth. This palette of techniques concludes with an extended chapter on neural networks and deep learning architectures. The book also covers the fundamentals of statistical parameter estimation, Wiener and Kalman filtering, convexity, and convex optimization, including a chapter on stochastic approximation and the gradient descent family of algorithms, presenting related online learning techniques as well as concepts and algorithmic versions for distributed optimization. Focusing on the physical reasoning behind the mathematics without sacrificing rigor, all the various methods and techniques are explained in depth, supported by examples and problems, giving an invaluable resource to the student and researcher for understanding and applying machine learning concepts. Most of the chapters include typical case studies and computer exercises, both in MATLAB and Python. The chapters are written to be as self-contained as possible, making the text suitable for different courses: pattern recognition
